

50 W + 50 W dual BTL class-D audio amplifier

Features

- 50 W + 50 W continuous output power at THD = 10% with $R_L = 6 \Omega$ and $V_{CC} = 25 V$
- 40 W + 40 W continuous output power at THD = 10% with $R_L = 8 \Omega$ and $V_{CC} = 25 V$
- Wide-range single-supply operation (8 - 26 V)
- High efficiency ($\eta = 90\%$)
- Four selectable, fixed gain settings of nominally 21.6 dB, 27.6 dB, 31.1 dB and 33.6 dB
- Differential inputs minimize common-mode noise
- Standby and mute features
- Short-circuit protection
- Thermal overload protection
- Externally synchronizable
- ECOPACK[®], environmentally-friendly package

Description

The TDA7492 is a dual BTL class-D audio amplifier with single power supply designed for LCD TVs and monitors.

Thanks to the high efficiency and exposed-pad-up (EPU) package only a simple heatsink is required.

Table 1. Device summary

f _{SW}	Switching frequency	Internal oscillator	290	310	330	kHz
f _{SWR}	Output switching frequency Range	With internal oscillator ⁽¹⁾	250	-	400	kHz
		With external oscillator ⁽²⁾	250	-	400	
V _{inH}	Digital input high (H)	-	2.3	-	-	V
V _{inL}	Digital input low (L)		-	-	0.8	
A _{MUTE}	Mute attenuation	V _{MUTE} = 1 V	60	80	-	dB

1. $f_{SW} = 10^6 / ((16 * R_{OSC} + 182) * 4)$ kHz, $f_{SYNCLK} = 2 * f_{SW}$ with R3 = 39 kΩ (see [Figure 28](#)).

2. $f_{SW} = f_{SYNCLK} / 2$ with the frequency of the external oscillator.

4 Characterization curves

The general test conditions used for producing the characterization curves can be summarized as follows:

Test board: SZ LAB TDA7492 slug-up demo board

Test frequency: 1 kHz (also 100 Hz for THD vs. output power only)

Output power: 1 W

- For 6-Ω loads
 - test voltage: 25 V
 - LC filter: L = 22 μH and C = 220 nF
- For 8-Ω loads
 - test voltage: 25 V
 - LC filter: L = 33 μH and C = 220 nF
- For 4-Ω loads
 - test voltage: 20 V
 - LC filter: L = 15 μH and C = 470 nF.

[Figure 28 on page 22](#) shows the circuit with which the characterization curves, shown in the next sections, were measured. [Figure 27 on page 21](#) shows the PCB layout.

5 Applications circuit

Figure 28. Applications circuit for class-D amplifier

6 Applications information

6.1 Mode selection

The three operating modes of the TDA7492 are set by the two inputs, STBY (pin 20) and MUTE (pin 21).

- Standby mode: all circuits are turned off, very low current consumption.
- Mute mode: inputs are connected to ground and the positive and negative PWM outputs are at 50% duty cycle.
- Play mode: the amplifiers are active.

The protection functions of the TDA7492 are enabled by pulling down the voltages of the STBY and MUTE inputs shown in *Figure 29*. The input current of the corresponding pins must be limited to 200 μ A.

Table 6. Mode settings

Mode	STBY	MUTE
Standby	L (1)	X (don't care)
Mute	H (1)	L
Play	H	H

1. Drive levels defined in *Table 5: Electrical specifications on page 9*

Figure 29. Standby and mute circuits

Figure 30. Turn on/off sequence for minimizing speaker “pop”

6.2 Gain setting

The gain of the TDA7492 is set by the two inputs, GAIN0 (pin 30) and GAIN1 (pin31). Internally, the gain is set by changing the feedback resistors of the amplifier.

Table 7. Gain settings

GAIN0	GAIN1	Nominal gain, G_v (dB)
0	0	21.6
0	1	27.6
1	0	31.1
1	1	33.6

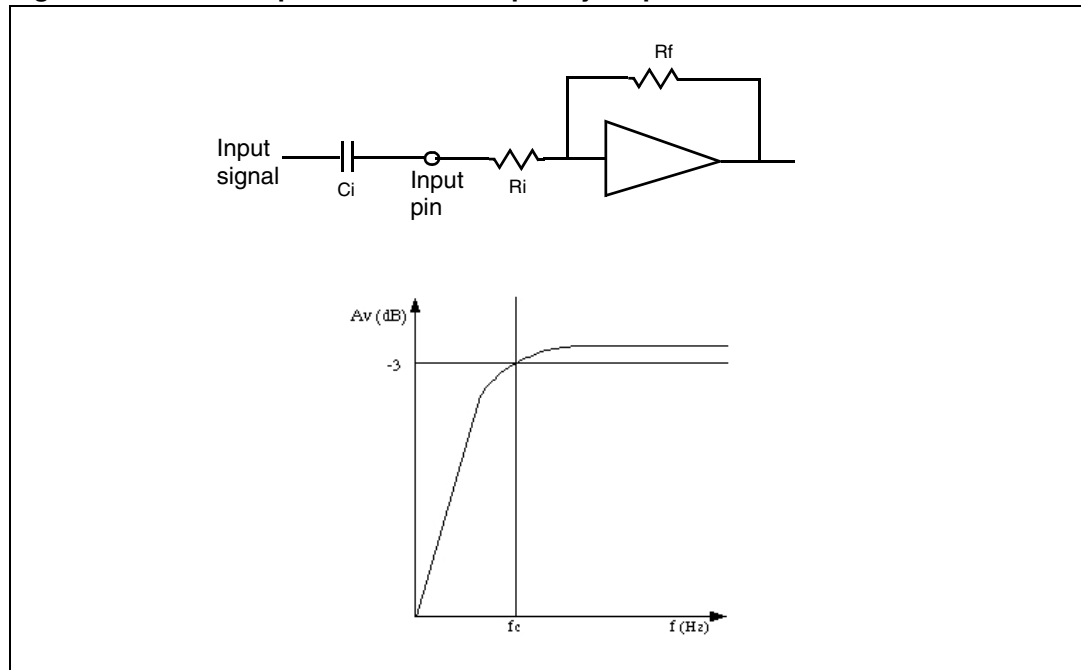

6.3 Input resistance and capacitance

The input impedance is set by an internal resistor $R_i = 60\text{ k}\Omega$ (typical). An input capacitor (C_i) is required to couple the AC input signal.

The equivalent circuit and frequency response of the input components are shown in [Figure 31](#). For $C_i = 470\text{ nF}$ the high-pass filter cutoff frequency is below 20 Hz:

$$f_c = 1 / (2 * \pi * R_i * C_i)$$

Figure 31. Device input circuit and frequency response

6.4 Internal and external clocks

The clock of the class-D amplifier can be generated internally or can be driven by an external source.

If two or more class-D amplifiers are used in the same system, it is recommended that all devices operate at the same clock frequency. This can be implemented by using one TDA7492 as master clock, while the other devices are in slave mode, that is, externally clocked. The clock interconnect is via pin SYNCLK of each device. As explained below, SYNCLK is an output in master mode and an input in slave mode.

6.4.1 Master mode (internal clock)

Using the internal oscillator, the output switching frequency, f_{SW} , is controlled by the resistor, R_{OSC} , connected to pin ROSC:

$$f_{SW} = 10^6 / ((R_{OSC} * 16 + 182) * 4) \text{ kHz}$$

where R_{OSC} is in $k\Omega$.

In master mode, pin SYNCLK is used as a clock output pin whose frequency is:

$$f_{SYNCLK} = 2 * f_{SW}$$

For master mode to operate correctly, then resistor R_{OSC} must be less than 60 $k\Omega$ as given below in [Table 8](#).

6.4.2 Slave mode (external clock)

In order to accept an external clock input the pin ROSC must be left open, that is, floating. This forces pin SYNCLK to be internally configured as an input as given in [Table 8](#).

The output switching frequency of the slave devices is:

$$f_{SW} = f_{SYNCLK} / 2$$

Table 8. How to set up SYNCLK

Mode	ROSC	SYNCLK
Master	$R_{OSC} < 60 \text{ k}\Omega$	Output
Slave	Floating (not connected)	Input

Figure 32. Master and slave connection

6.5 Output low-pass filter

To avoid EMI problems, it may be necessary to use a low-pass filter before the speaker. The cutoff frequency should be larger than 22 kHz and much lower than the output switching frequency. It is necessary to choose the L-C component values depending on the loud speaker impedance. Some typical values, which give a cutoff frequency of 27 kHz, are shown in [Figure 33](#) and [Figure 34](#) below.

Figure 33. Typical LC filter for a 8-Ω speaker

Figure 34. Typical LC filter for a 4-Ω speaker

6.6 Protection functions

The TDA7492 is fully protected against overvoltages, undervoltages, overcurrents and thermal overloads as explained here.

Overvoltage protection (OVP)

If the supply voltage exceeds the value for V_{OVP} given in [Table 5: Electrical specifications on page 9](#) the overvoltage protection is activated which forces the outputs to the high-impedance state. When the supply voltage drops to below the threshold value the device restarts.

Undervoltage protection (UVP)

If the supply voltage drops below the value for V_{UVP} given in [Table 5: Electrical specifications on page 9](#) the undervoltage protection is activated which forces the outputs to the high-impedance state. When the supply voltage recovers the device restarts.

Overcurrent protection (OCP)

If the output current exceeds the value for I_{OCP} given in [Table 5: Electrical specifications on page 9](#) the overcurrent protection is activated which forces the outputs to the high-impedance state. Periodically, the device attempts to restart. If the overcurrent condition is still present then the OCP remains active. The restart time, T_{OC} , is determined by the R-C components connected to pin STBY.

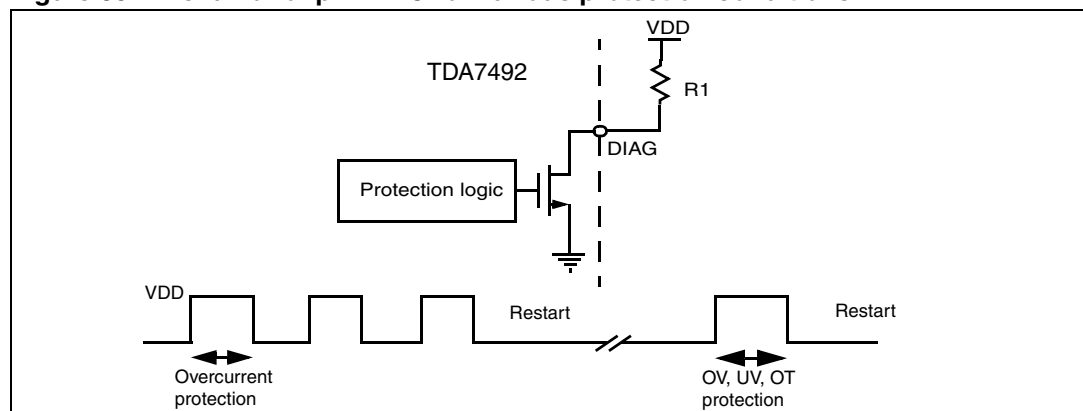

Thermal protection (OTP)

If the junction temperature, T_j , reaches 145 °C (nominally), the device goes to mute mode and the positive and negative PWM outputs are forced to 50% duty cycle. If the junction temperature reaches the value for T_j given in [Table 5: Electrical specifications on page 9](#) the device shuts down and the output is forced to the high-impedance state. When the device cools sufficiently the device restarts.

6.7 Diagnostic output

The output pin DIAG is an open drain transistor. When the protection is activated it is in the high-impedance state. The pin can be connected to a power supply (<26 V) by a pull-up resistor whose value is limited by the maximum sinking current (200 μ A) of the pin.

Figure 35. Behavior of pin DIAG for various protection conditions

6.8 Heatsink requirements

As with most amplifiers, the power dissipated within the device depends primarily on the supply voltage, the load impedance and the output modulation level.

The maximum estimated power dissipation for the TDA7492 is around 7 W. At 25 °C ambient a heatsink having $R_{th} = 15 \text{ °C/W}$ is sufficient for sine-wave testing at maximum power. A musical program, however, dissipates about 40% less power than this and a heatsink with $R_{th} = 25 \text{ °C/W}$ is thus recommended. Even at the maximum recommended ambient temperature for consumer applications of 50 °C there is still a clear safety margin before the maximum junction temperature (150 °C) is reached.

7 Package mechanical data

The TDA7492 comes in a 36-pin PowerSSO package with exposed pad up (EPU).

[Figure 36](#) shows the package outline and [Table 9](#) gives the dimensions.

Figure 36. PowerSSO-36 EPU outline drawing
