# 64-Channel Serial to Parallel Converter With High Voltage Push-Pull Outputs 

## Features

- Processed with HVCMOS ${ }^{\circledR}$ technology
- Operating output voltages to 300 V
- Low power level shifting from 5.0 to 300 V
- Shift register speed: 8.0 MHz @ $\mathrm{V}_{\mathrm{DD}}=5.0 \mathrm{~V}$
- 64 latched data outputs
- Output polarity and blanking
- CMOS compatible inputs
- Foreward and reverse shifting options

## General Description

The HV507 is a low voltage serial to high voltage parallel converter with 64 push-pull outputs. This device has been designed for use as a printer driver for electrostatic applications. It can also be used in any application requiring multiple output, high voltage, low current sourcing and sinking capabilities.

The device consists of a 64-bit shift register, 64 latches, and control logic to perform the polarity select and blanking of the outputs. A DIR pin controls the direction of data shift through the device. With DIR grounded, $D_{10} A$ is Data-In and $D_{10} B$ is Data-Out; data is shifted from $\mathrm{HV}_{\text {out }} 64$ to $\mathrm{HV}_{\text {out }} 1$. When DIR is at logic high, $D_{10} B$ is Data-In and $D_{10} A$ is Data-Out: data is then shifted from $\mathrm{HV}_{\text {out }} 1$ to $\mathrm{HV}_{\text {out }} 64$. Data is shifted through the shift register on the low to high transition of the clock. Data output buffers are provided for cascading devices. Operation of the shift register is not affected by the $\overline{\mathrm{LE}}$ (latch enable), $\overline{\mathrm{BL}}$ (blanking), or the $\overline{\mathrm{POL}}$ (polarity) inputs. Transfer of data from the shift register to the latch occurs when the $\overline{\mathrm{LE}}$ is high. The data in the latch is stored during $\overline{\mathrm{LE}}$ transition from high to low.

## Absolute Maximum Ratings

| Parameter | Value |
| :--- | ---: |
| Supply voltage, $\mathrm{V}_{\mathrm{DD}}$ | -0.5 V to +6.0 V |
| Supply voltage, $\mathrm{V}_{\mathrm{PP}}$ | $\mathrm{V}_{\mathrm{DD}}$ to +320 V |
| Logic input levels | -0.5 V to $\mathrm{V}_{\mathrm{DD}}+0.5 \mathrm{~V}$ |
| Ground current ${ }^{2}$ | 0.5 A |
| High voltage supply current ${ }^{1}$ | 0.5 A |
| Continuous total power dissipation ${ }^{2}$ | 1200 mW |
| Operating temperature range | $0^{\circ} \mathrm{C}$ to $+70^{\circ} \mathrm{C}$ |
| Storage temperature range | $-65^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$ |

Absolute Maximum Ratings are those values beyond which damage to the device may occur. Functional operation under these conditions is not implied. Continuous operation of the device at the absolute rating level may affect device reliability. All voltages are referenced to GND.

## Notes:

1. Connection to all power and ground pads is required. Duty cycle is limited by the total power dissipated in the package.
2. For operation above $25^{\circ} \mathrm{C}$ ambiant derate linearly to $70^{\circ} \mathrm{C}$ at $26.7 \mathrm{~mW} /$ ${ }^{\circ} \mathrm{C}$.

## Recommended Operating Conditions

| Sym | Parameter | Min | Typ | Max | Units |
| :---: | :--- | :---: | :---: | :---: | :---: |
| $\mathrm{V}_{\mathrm{DD}}$ | Logic supply voltage | 4.5 | 5.0 | 5.5 | V |
| $\mathrm{~V}_{\mathrm{PP}}$ | High voltage supply | 60 | - | 300 | V |

| $\mathrm{V}_{\mathrm{IL}}$ | Low-level input voltage | 0 | - | 0.9 | V |
| $\mathrm{~T}_{\mathrm{A}}$ | Operating free-air temperature | 0 | - | +70 | ${ }^{\circ} \mathrm{C}$ |

Power-up sequence should be the following:

1. Connect ground
2. Apply $V_{D D}$
3. Set all inputs (Data, CLK, Enable, etc.) to a known state
4. Apply $V_{P P}$
5. The $V_{P P}$ should not drop below $V_{D D}$ or float during operation.

Power-down sequence should be the reverse of the above.
