

## SP207EH–SP213EH

### High Speed +5V High Performance RS232 Transceivers

- Single +5V Supply Operation
- 0.1 $\mu$ F External Charge Pump Capacitors
- 500Kbps Data Rate Under Load
- Standard SOIC and SSOP Packages
- Lower Supply Current Than Competition (typical 3mA)
- 1 $\mu$ A Shutdown Mode
- WakeUp Feature in Shutdown Mode
- Tri-State Receiver Outputs
- Ideal for High Speed RS-232 Applications
- Improved ESD Specifications:
  - ±15kV Human Body Model
  - ±15kV IEC1000-4-2 Air Discharge
  - ±8kV IEC1000-4-2 Contact Discharge

#### DESCRIPTION

The **SP207EH/208EH/211EH/213EH** devices are high speed enhanced multi-channel RS-232 line transceivers with improved electrical performance. The **SP207EH/208EH/211EH/213EH** series is a superior drop-in replacement to our previous versions as well as popular industry standards. All devices feature low-power CMOS construction and the Sipex-patented (5,306,954) on-board charge pump circuitry that generates the  $\pm 10$ V RS-232 voltage levels using 0.1 $\mu$ F charge pump capacitors. The **SP211E** and **SP213E** devices feature a low-power shutdown mode, which reduces power supply drain to 1 $\mu$ A. Enhancements to this series include a higher transmission rate of 500Kbps, a lower power supply current at 3mA typical (no load), and superior ESD performance. The ESD tolerance has been improved for this series to over  $\pm 15$ kV for both Human Body Model and IEC1000-4-2 Air Discharge test methods.

## FEATURES

As in the original RS-232 multi-channel products, the **SP207EH Series** high speed multi-channel RS-232 line transceivers provide a variety of configurations to fit most designs, especially high speed applications where  $\pm 12V$  is not available. The **SP207EH Series** is a superior high speed drop-in replacement to our previous versions as well as popular industry standards.

All devices in this series feature low-power CMOS construction and **Sipex's** proprietary on-board charge pump circuitry to generate the  $\pm 10V$  RS-232 voltage levels. The ability to use  $0.1\mu F$  charge pump capacitors saves board space and reduces production costs. The devices in this series provide different driver/receiver combinations to match any application requirement.

The **SP211EH** and **SP213EH** models feature a low-power shutdown mode, which reduces power supply drain to  $1\mu A$ . The **SP213EH** includes a Wake-Up function which keeps two receivers active in the shutdown mode, unless disabled by the EN pin.

The family is available in 28-pin SO (wide) and SSOP (shrink) small outline packages. Devices can be specified for commercial ( $0^{\circ}C$  to  $+70^{\circ}C$ ) and industrial/extended ( $-40^{\circ}C$  to  $+85^{\circ}C$ ) operating temperatures.

## THEORY OF OPERATION

The **SP207EH Series** devices are made up of three basic circuit blocks — 1) transmitter/driver, 2) receiver and 3) the **SIPEX**—proprietary charge pump. Each model within the Series incorporates variations of these circuits to achieve the desired configuration and performance.

## Charge-Pump

The charge pump is a **Sipex**—patented design (5,306,954) and uses a unique approach compared to older less-efficient designs. The charge pump still requires four external capacitors, but uses a four-phase voltage shifting technique to attain symmetrical  $10V$  power supplies. **Figure 3a** shows the waveform found on the positive side of capacitor  $C_2$ , and **Figure 3b** shows the negative side of capacitor  $C_2$ . There is a free-running oscillator that controls the four phases of the voltage shifting. A description of each phase follows.

### Phase 1

—  $V_{SS}$  charge storage — During this phase of the clock cycle, the positive side of capacitors  $C_1$  and  $C_2$  are initially charged to  $+5V$ .  $C_1^+$  is then switched to ground and the charge in  $C_1^-$  is transferred to  $C_2^-$ . Since  $C_2^+$  is connected to  $+5V$ , the voltage potential across capacitor  $C_2$  is now  $10V$ .

### Phase 2

—  $V_{SS}$  transfer — Phase two of the clock connects the negative terminal of  $C_2$  to the  $V_{SS}$  storage capacitor and the positive terminal of  $C_2$  to ground, and transfers the generated  $-10V$  to  $C_3$ . Simultaneously, the positive side of capacitor  $C_1$  is switched to  $+5V$  and the negative side is connected to ground.

### Phase 3

—  $V_{DD}$  charge storage — The third phase of the clock is identical to the first phase — the charge transferred in  $C_1$  produces  $-5V$  in the negative terminal of  $C_1$ , which is applied to the negative side of capacitor  $C_2$ . Since  $C_2^+$  is at  $+5V$ , the voltage potential across  $C_2$  is  $10V$ .

**Figure 1. Charge Pump — Phase 1**

Figure 2. Charge Pump — Phase 2

### Phase 4

—  $V_{DD}$  transfer — The fourth phase of the clock connects the negative terminal of  $C_2$  to ground, and transfers the generated 10V across  $C_2$  to  $C_4$ , the  $V_{DD}$  storage capacitor. Again, simultaneously with this, the positive side of capacitor  $C_1$  is switched to +5V and the negative side is connected to ground, and the cycle begins again.

Since both  $V^+$  and  $V^-$  are separately generated from  $V_{CC}$ ; in a no-load condition  $V^+$  and  $V^-$  will be symmetrical. Older charge pump approaches that generate  $V^-$  from  $V^+$  will show a decrease in the magnitude of  $V^-$  compared to  $V^+$  due to the inherent inefficiencies in the design.

The clock rate for the charge pump typically operates at 15kHz. The external capacitors can be as low as 0.1 $\mu$ F with a 16V breakdown voltage rating.

### Transmitter/Driver

The drivers of the **SP207EH Series** can maintain a typical data rate of 500Kbps. This superior RS-232 data transmission rate makes the **SP207EH Series** an ideal match for many

designs in personal computer peripherals and LAN applications that demand high speed performance.

The drivers are inverting transmitters, which accept either TTL or CMOS inputs and output the RS-232 signals with an inverted sense relative to the input logic levels. Typically, the RS-232 output voltage swing is  $\pm 9V$  with no load, and  $\pm 5V$  minimum with full load. The transmitter outputs are protected against infinite short-circuits to ground without degradation in reliability. The drivers of the **SP211EH**, and **SP213EH** can be tri-stated by using the SHUTDOWN function.

In the “power-off” state, the output impedance will remain greater than 300 ohms, again satisfying the RS-232 specifications. Should the input of the driver be left open, an internal 400Kohm pullup resistor to  $V_{CC}$  forces the input high, thus committing the output to a low state. The slew rate of the transmitter output is internally limited to a maximum of 30V/ $\mu$ s in order to meet the EIA standards (EIA RS-232D 2.1.7, Paragraph 5). The transition of the loaded output from high to low also meets the monotonicity requirements of the standard.

Figure 3. Charge Pump Waveforms

Figure 4. Charge Pump — Phase 3

Figure 5. Charge Pump — Phase 4

## Receivers

The high performance receivers of the **SP207EH Series** can accept input signals at a typical data rate of 500Kbps. The receivers convert RS-232 input signals to inverted TTL signals. The receivers convert RS-232 input signals to inverted TTL signals. Since the input is usually from a transmission line where long cable lengths and system interference can degrade the signal, the inputs have a typical hysteresis margin of 500mV. This ensures that the receiver is virtually immune to noisy transmission lines. Should an input be left unconnected, a 5k $\Omega$  pulldown resistor to ground will commit the output of the receiver to a high state.

## SHUTDOWN MODE

The **SP211EH**, and **SP213EH** all feature a control input which will disable the device and reduce the power supply current to less than 10 $\mu$ A, making the parts ideal for battery-powered systems. In the “shutdown” mode the receivers and transmitters will both be tri-stated. The  $V^+$  output of the charge pump will discharge to  $V_{CC}$ , and the  $V^-$  output will discharge to ground. Products with the Wake-Up function can enable or disable the receivers during shutdown.

For complete shutdown to occur and the 10 $\mu$ A power drain to be realized, the following conditions must be met:

### SP211EH:

- +5V must be applied to the SD pin
- ENABLE must be either 0V, +5.0V or not connected
- the transmitter inputs must be either +5.0V or not connected
- $V_{CC}$  must be +5V
- Receiver inputs must be >0V and <+5V

### SP213EH:

- 0V must be applied to the  $\overline{SD}$  pin
- ENABLE must be either 0V, +5.0V or not connected
- the transmitter inputs must be either +5.0V or not connected
- $V_{CC}$  must be +5V
- Receiver inputs must be >0V and <+5V

## ENABLE

The **SP211EH** and **SP213EH** all feature an enable input, which allows the receiver outputs to be either tri-stated or enabled. This can be especially useful when the receiver is tied directly to a microprocessor data bus. For the **SP211EH**, enable is active low; that is, 0V applied to the ENABLE pin will enable the receiver outputs. For the **SP213EH**, enable is active high; that is, +5V applied to the ENABLE pin will enable the receiver outputs.

SD	EN	SP213EH Only		Power Up/Down	Receiver Outputs
		SD	EN		
0	0	1	1	Up	Enable
0	1	1	0	Up	Tri-state
1	0	0	1	Down	Enable
1	1	0	0	Down	Tri-state

Table 2. Wake-Up Truth Table

Figure 6. Wake-Up Timing

## WAKEUP FUNCTION

The **SP213EH** has a wake-up feature that keeps two receivers ( $R_4$  and  $R_5$ ) in an enabled state when the device is in the shutdown mode. With only the receivers active during shutdown, the devices draw 5–10 $\mu$ A of supply current.

A typical application of this function would be where a modem is interfaced to a computer in a power-down mode. The ring indicator signal from the modem could be passed through an active receiver in the **SP213EH** that is itself in the shutdown mode. The ring indicator signal would propagate through the **SP213EH** to the power management circuitry of the computer to power up the microprocessor and the **SP213EH** drivers. After the supply voltage to the **SP213EH** reaches +5.0V, the SHUTDOWN pin can be disabled, taking the **SP213EH** out of the shutdown mode.

All receivers that are active during shutdown maintain 500mV (typical) of hysteresis.

## ESD TOLERANCE

The **SP207EH** Family incorporates ruggedized ESD cells on all driver output and receiver input pins. The ESD structure is improved over our previous family for more rugged applications and environments sensitive to electro-static discharges and associated transients. The improved ESD tolerance is at least  $\pm 15$ kV without damage nor latch-up.

There are different methods of ESD testing applied:

- MIL-STD-883, Method 3015.7
- IEC1000-4-2 Air-Discharge
- IEC1000-4-2 Direct Contact

The Human Body Model has been the generally accepted ESD testing method for semiconductors. This method is also specified in MIL-STD-883, Method 3015.7 for ESD testing. The premise of this ESD test is to simulate the human body's potential to store electro-static energy and discharge it to an integrated circuit. The simulation is performed by using a test model as shown in **Figure 7**. This method will test the IC's capability to withstand an ESD transient during normal handling such as in manufacturing areas where the ICs tend to be handled frequently.

The IEC-1000-4-2, formerly IEC801-2, is generally used for testing ESD on equipment and systems. For system manufacturers, they must guarantee a certain amount of ESD protection since the system itself is exposed to the outside environment and human presence. The premise with IEC1000-4-2 is that the system is required to withstand an amount of static electricity when ESD is applied to points and surfaces of the equipment that are accessible to personnel during normal usage. The transceiver IC receives most of the ESD current when the ESD source is applied to the connector pins. The test circuit for IEC1000-4-2 is shown on **Figure 8**. There are two methods within IEC1000-4-2, the Air Discharge method and the Contact Discharge method.

**Figure 7. ESD Test Circuit for Human Body Model**

Figure 8. ESD Test Circuit for IEC1000-4-2

With the Air Discharge Method, an ESD voltage is applied to the equipment under test (EUT) through air. This simulates an electrically charged person ready to connect a cable onto the rear of the system only to find an unpleasant zap just before the person touches the back panel. The high energy potential on the person discharges through an arcing path to the rear panel of the system before he or she even touches the system. This energy, whether discharged directly or through air, is predominantly a function of the discharge current rather than the discharge voltage. Variables with an air discharge such as approach speed of the object carrying the ESD potential to the system and humidity will tend to change the discharge current. For example, the rise time of the discharge current varies with the approach speed.

The Contact Discharge Method applies the ESD current directly to the EUT. This method was devised to reduce the unpredictability of the ESD arc. The discharge current rise time is constant since the energy is directly transferred without the air-gap arc. In situations such as hand held systems, the ESD charge can be directly discharged to the equipment from a person already holding the equipment. The current is transferred on to the keypad or the serial port of the equipment directly and then travels through the PCB and finally to the IC.

Figure 9. ESD Test Waveform for IEC1000-4-2

The circuit model in **Figures 7 and 8** represent the typical ESD testing circuit used for all three methods. The  $C_S$  is initially charged with the DC power supply when the first switch (SW1) is on. Now that the capacitor is charged, the second switch (SW2) is on while SW1 switches off. The voltage stored in the capacitor is then applied through  $R_S$ , the current limiting resistor, onto the device under test (DUT). In ESD tests, the SW2 switch is pulsed so that the device under test receives a duration of voltage.

For the Human Body Model, the current limiting resistor ( $R_s$ ) and the source capacitor ( $C_s$ ) are  $1.5k\Omega$  and  $100pF$ , respectively. For IEC-1000-4-2, the current limiting resistor ( $R_s$ ) and the source capacitor ( $C_s$ ) are  $330\Omega$  and  $150pF$ , respectively.

The higher  $C_s$  value and lower  $R_s$  value in the IEC1000-4-2 model are more stringent than the Human Body Model. The larger storage capacitor injects a higher voltage to the test point when SW2 is switched on. The lower current limiting resistor increases the current charge onto the test point.

## EIA STANDARDS

The Electronic Industry Association (EIA) developed several standards of data transmission which are revised and updated in order to meet the requirements of the industry. In data processing, there are two basic means of communicating between systems and components. The RS-232 standard was first introduced in 1962 and, since that time, has become an industry standard.

The RS-232 is a relatively slow data exchange protocol, with a maximum baud rate of only 20kbps, which can be transmitted over a maximum copper wire cable length of 50 feet. The **SP207EH** through **SP213EH** Series of data communications interface products have been designed to meet both the EIA protocol standards, and the needs of the industry.

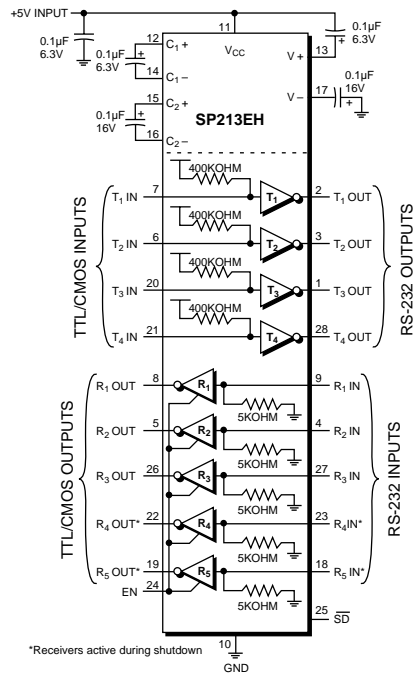

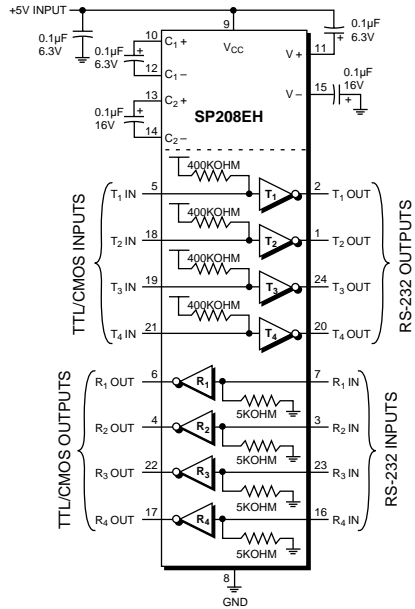

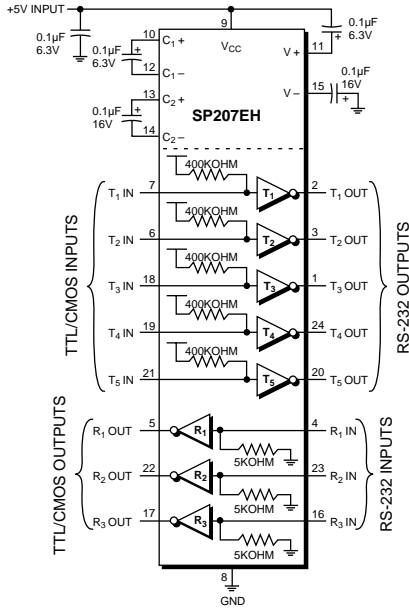

DEVICE PIN TESTED	HUMAN BODY MODEL	IEC1000-4-2

## ORDERING INFORMATION

### RS232 Transceivers:

Model	Drivers	Receivers	Temperature Range	Package Type
SP207EHCA	5	3	0°C to +70°C	24-pin SSOP
SP207EHCP	5	3	0°C to +70°C	24-pin Plastic DIP
SP207EHCT	5	3	0°C to +70°C	24-pin SOIC
SP207EHEA	5	3	-40°C to +85°C	24-pin SSOP
SP207EHEP	5	3	-40°C to +85°C	24-pin Plastic DIP
SP207EHET	5	3	-40°C to +85°C	24-pin SOIC
SP208EHCA	4	4	0°C to +70°C	24-pin SSOP
SP208EHCP	4	4	0°C to +70°C	24-pin Plastic DIP
SP208EHCT	4	4	0°C to +70°C	24-pin SOIC
SP208EHEA	4	4	-40°C to +85°C	24-pin SSOP
SP208EHEP	4	4	-40°C to +85°C	24-pin Plastic DIP
SP208EHET	4	4	-40°C to +85°C	24-pin SOIC

### RS232 Transceivers with Low-Power Shutdown and Tri-state Enable:

Model	Drivers	Receivers	Temperature Range	Package Type
SP211EHCA	4	5	0°C to +70°C	28-pin SSOP
SP211EHCT	4	5	0°C to +70°C	28-pin SOIC
SP211EHEA	4	5	-40°C to +85°C	28-pin SSOP
SP211EHET	4	5	-40°C to +85°C	28-pin SOIC

### RS232 Transceivers with Low-Power Shutdown, Tri-state Enable, and Wake-Up Function:

Model	Drivers	Receivers	Temperature Range	Package Type
SP213EHCA	4	5, with 2 active in Shutdown	0°C to +70°C	28-pin SSOP
SP213EHCT	4	5, with 2 active in Shutdown	0°C to +70°C	28-pin SOIC
SP213EHEA	4	5, with 2 active in Shutdown	-40°C to +85°C	28-pin SSOP
SP213EHET	4	5, with 2 active in Shutdown	-40°C to +85°C	28-pin SOIC

Please consult the factory for pricing and availability on a Tape-On-Reel option.
