

# TDA7466

## DIGITALLY CONTROLLED AUDIO PROCESSOR WITH SRS SURROUND SOUND AND VOICE CANCELLER

everything else is only stereo™

The Device incorporates the SRS WOW® Technology under licence from SRS Labs, Inc.

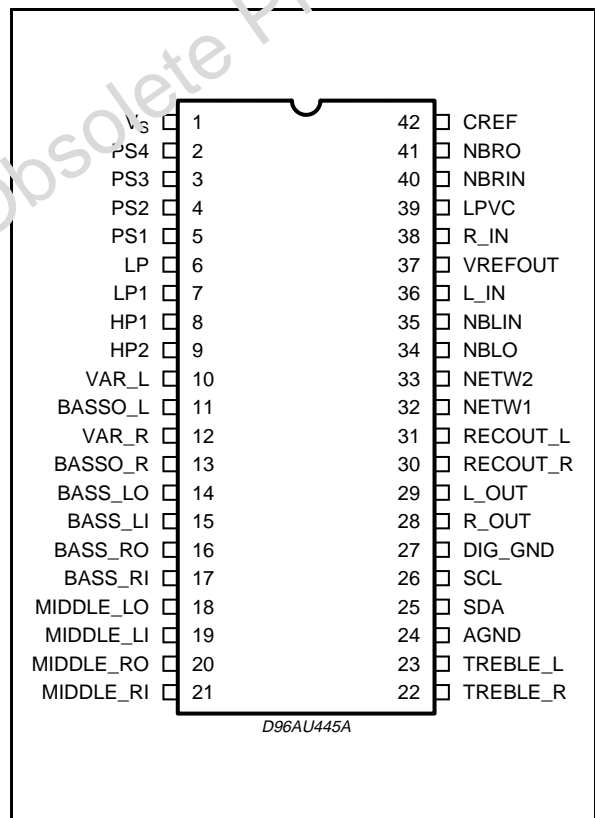

- 1 STEREO INPUT
- INPUT ATTENUATION CONTROL IN 0.5dB STEP
- TREBLE MIDDLE AND BASS CONTROL
- VOICE CANCELLER IS AVAILABLE
- STEREO SRS SURROUND SOUND WITH CENTER & SPACE CONTROL IS AVAILABLE
- THREE STANDARD SURROUND MODES ARE AVAILABLE:
  - MUSIC IN 4 DIFFERENT SELECTABLE RESPONSES
  - MOVIE AND SIMULATED IN 256 DIFFERENT SELECTABLE RESPONSES
- 2 SPEAKERS OUTPUTS
  - INDEPENDENT ATTENUATORS IN 1dB STEP FOR BALANCE FACILITY
  - ZERO CROSSING ATTENUATION AVAILABLE
  - AVAILABILITY OF LOUDSPEAKERS EQUALIZATION FIXED BY EXTERNAL COMPONENTS
  - INDEPENDENT MUTE FUNCTION
- 2 RECORD OUTPUTS
  - INDEPENDENT ATTENUATORS IN 1dB STEP FOR BALANCE FACILITY
  - MUX AVAILABLE FOR PROCESSES SIGNAL SELECTION
  - INDEPENDENT MUTE FUNCTION
- ALL FUNCTIONS PROGRAMMABLE VIA SERIAL BUS

### DESCRIPTION

The TDA7466 is a volume tone (bass middle and treble) balance (Left/Right) processors with stereo SRS and voice canceller for quality audio applications in car radio, Hi-Fi, TV systems. It reproduces SRS (Sound Retrieval System) sound by external components and surround sound by using phase shifters and a signal matrix. The AC signal setting is obtained by resistor networks and switches combined with operational amplifiers according to the SRS laboratories specification. Control of all the functions is ac-

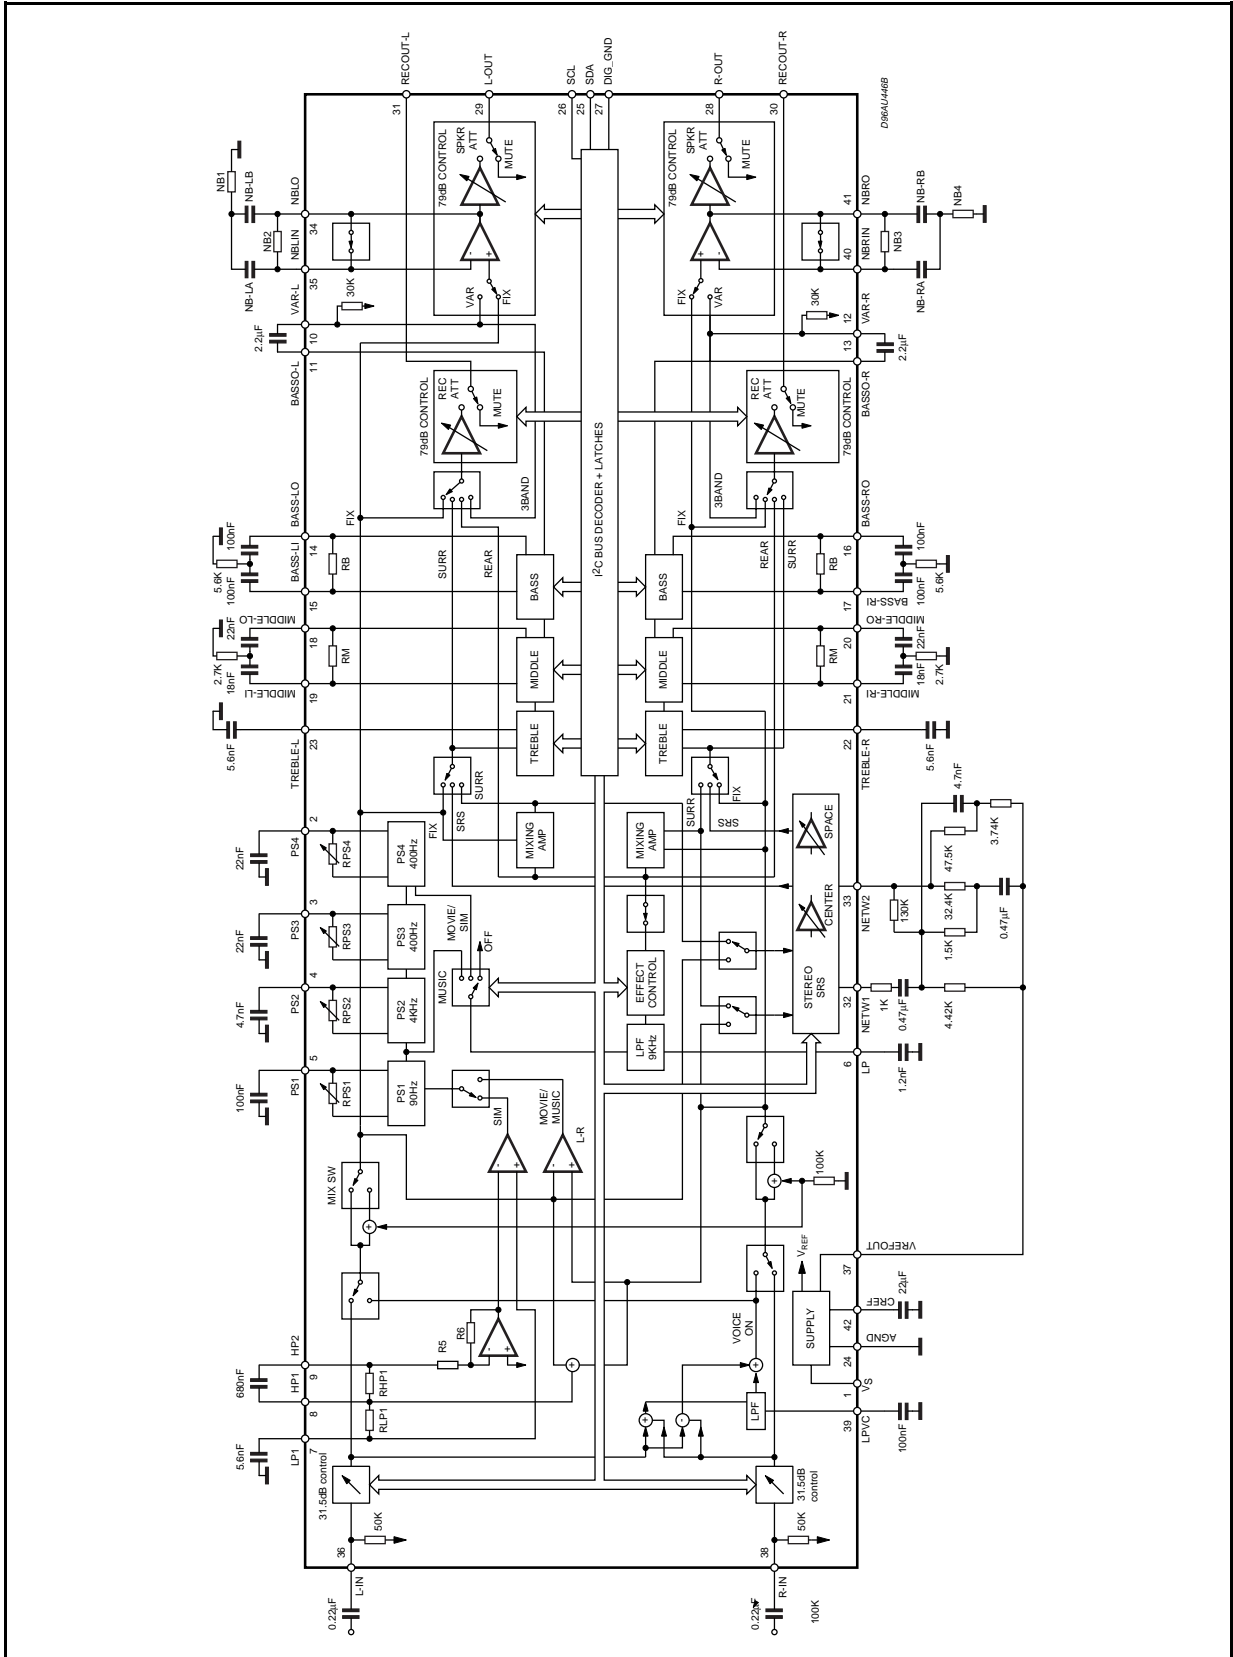

### PIN CONNECTION

complished by serial bus. Thanks to the used BIPOLAR/CMOS Technology, Low Distortion, Low Noise and DC stepping are obtained.

BLOCK DIAGRAM

## THERMAL DATA

Symbol	Description	Value	Unit
$R_{th\ j-pins}$	Thermal Resistance Junction-pins	Max. 85	°C/W

## ABSOLUTE MAXIMUM RATINGS

Symbol	Parameter	Value	Unit
$V_S$	Operating Supply Voltage	11	V
$T_{amb}$	Operating Ambient Temperature	-10 to 85	°C
$T_{stg}$	Storage Temperature Range	-55 to +150	°C

## QUICK REFERENCE DATA

Symbol	Parameter	Min.	Typ.	Max.	Unit
$V_S$	Supply Voltage	7	9	10.2	V
$V_{CL}$	Max. input signal handling	2			Vrms
THD	Total Harmonic Distortion $V = 1V_{rms}$ $f = 1KHz$		0.01	0.1	%
S/N	Signal to Noise Ratio $V_{out} = 1V_{rms}$ (mode = OFF)		106		dB
$S_C$	Channel Separation $f = 1KHz$		90		dB
	Input Attenuation Control (0.5dB)	-31.5		0	dB
	Treble Control (2db step)	-14		+14	dB
	Middle Control (2db step)	-14		+14	dB
	Bass Control (2dB step)	-14		+14	dB
	Balance Control 1dB step (LCH, RCH)	-79		0	dB
	Mute Attenuation		100		dB

**ELECTRICAL CHARACTERISTICS** (refer to the test circuit  $T_{amb} = 25^{\circ}C$ ,  $V_S = 9V$ ,  $R_L = 10K\Omega$ ,  $V_{in} = 1V_{rms}$ ;  $R_G = 600\Omega$ , all controls flat ( $G = 0dB$ ), Effect Ctrl = -6dB, MODE = OFF;  $f = 1KHz$  unless otherwise specified)

**I<sup>2</sup>C BUS INTERFACE**

Data transmission from microprocessor to the TDA7466 and viceversa takes place through the 2 wires I<sup>2</sup>C BUS interface, consisting of the two lines SDA and SCL (pull-up resistors to positive supply voltage must be connected).

**Data Validity**

As shown in fig. 3, the data on the SDA line must be stable during the high period of the clock. The HIGH and LOW state of the data line can only change when the clock signal on the SCL line is LOW.

**Start and Stop Conditions**

As shown in fig.4 a start condition is a HIGH to LOW transition of the SDA line while SCL is HIGH. The stop condition is a LOW to HIGH transition of the SDA line while SCL is HIGH.

**Byte Format**

Every byte transferred on the SDA line must contain 8 bits. Each byte must be followed by an ac-

knowledge bit. The MSB is transferred first.

**Acknowledge**

The master (μP) puts a resistive HIGH level on the SDA line during the acknowledge clock pulse (see fig. 5). The peripheral (audioprocessor) that acknowledges has to pull-down (LOW) the SDA line during this clock pulse.

The audioprocessor which has been addressed has to generate an acknowledge after the reception of each byte, otherwise the SDA line remains at the HIGH level during the ninth clock pulse time. In this case the master transmitter can generate the STOP information in order to abort the transfer.

**Transmission without Acknowledge**

Avoiding to detect the acknowledge of the audioprocessor, the μP can use a simpler transmission: simply it waits one clock without checking the slave acknowledging, and sends the new data.

This approach of course is less protected from misworking.

**Figure 3:** Data Validity on the I<sup>2</sup>CBUS

**Figure 4:** Timing Diagram of I<sup>2</sup>CBUS

**Figure 5:** Acknowledge on the I<sup>2</sup>CBUS

# TDA7466

## SOFTWARE SPECIFICATION

Interface Protocol

The interface protocol comprises:

- A start condition (S)
- A chip address byte, containing the TDA7466

address

- A subaddress bytes
- A sequence of data (N byte + acknowledge)
- A stop condition (P)

ACK = Acknowledge  
 S = Start  
 P = Stop  
 A = Address  
 B = Auto Increment

## EXAMPLES

### No Incremental Bus

The TDA7466 receives a start condition, the cor-

rect chip address, a subaddress with the MSB = 0 (no incremental bus), N-data (all these data concern the subaddress selected), a stop condition.

### Incremental Bus

The TDA7466 receives a start condition, the correct chip address, a subaddress with the MSB = 1 (incremental bus): now it is in a loop condition with an autoincrease of the subaddress whereas

SUBADDRESS from "1XXX1010" to "1XXX1111" of DATA are ignored. The DATA 1 concerns the subaddress sent, and the DATA 2 concerns the subaddress sent plus one in the loop etc. and, at the end, it receives the stop condition.

**DATA BYTES** (Address = 80(HEX)):

**FUNCTION SELECTION:**

The first byte (subaddress)
