

Gigabit 8 x 8 CROSSPOINT SWITCH

Check for Samples: [SN65LVCP408](#)

FEATURES

- Up to 4.25 Gbps Operation
- Non-Blocking Architecture Allows Each Output to be Connected to Any Input
- 30 ps of Deterministic Jitter
- Selectable Transmit Pre-Emphasis Per Lane
- Selectable Receive Equalization
- Available Packaging 64 Pin QFP
- Propagation Delay Times: 500 ps Typical
- Inputs Electrically Compatible With CML Signal Levels
- Operates From a Single 3.3-V Supply
- Ability to 3-STATE Outputs
- Integrated Termination Resistors
- I²C™ Control Interface

APPLICATIONS

- Clock Buffering/Clock MUXing
- Wireless Base Stations
- High-Speed Network Routing
- Telecom/Datacom
- XAUI 802.3ae Protocol Backplane Redundancy

DESCRIPTION

The SN65LVCP408 is a 8 × 8 non-blocking crosspoint switch in a flow-through pin-out allowing for ease in PCB layout. VML signaling is used to achieve a high-speed data throughput while using low power. Each of the output drivers includes a 8:1 multiplexer to allow any input to be routed to any output. Internal signal paths are fully differential to achieve the high signaling speeds while maintaining low signal skews. The SN65LVCP408 incorporates 100-Ω termination resistors for those applications where board space is a premium. Built-in transmit pre-emphasis and receive equalization for superior signal integrity performance.

The SN65LVCP408 is characterized for operation from –40°C to 85°C. (See operating free air condition requirements)

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

PowerPAD is a trademark of Texas Instruments.

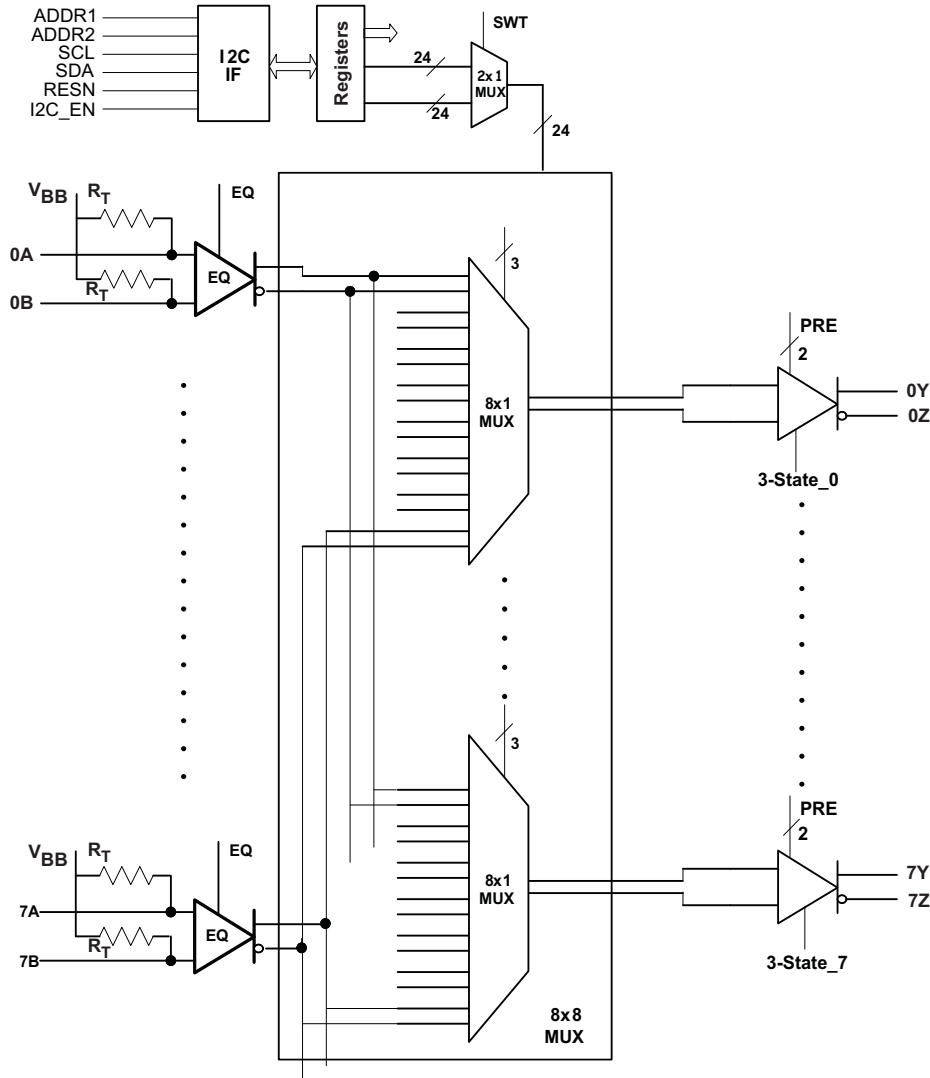

I²C is a trademark of Philips Electronics.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

PIN FUNCTIONS

Pin		TYPE	DESCRIPTION
NAME	NO.		
High Speed I/O			
xA	5, 8, 11, 14, 18, 21, 24, 27	Differential Inputs (with 50-Ω termination to V _{bb}) xA=P; xB=N	Line Side Differential Inputs CML compatible
xB	6, 9, 12, 15, 19, 22, 25, 28		
xY	34, 37, 40, 43, 51, 54, 57, 60	Differential Output xY=P; xZ=N	Switch Side Differential Outputs. VML
xZ	33, 36, 39, 42, 50, 53, 56, 59		
Control Signals			
SCL	45	Inputs	I ² C Control Interface (SCL: Clock, SDA: Data, ADDR: Address)
SDA	46		
ADDR1	47		
ADDR2	48		
EQ	31	Input	Equalization setting when I ² C is not enabled. EQ=0 for 13dB and setting EQ=1 for 9dB.
PRE	32	Input	Pre-Emphasis setting when I ² C is not enabled. PRE=0 for 0 dB and PRE=1 for 6 dB
I2C_EN	63	Input	Enables I ² C control interface I ² C_EN=1 for enable; When EN=0 then the PRE and EQ pins are used to set the Pre-Emphasis and Equalization settings rather than the I2C register map. When EN=0 the I ² C register map is still open for read and write operations.
SWT	62	Input	Enable switch event when toggled
RESN	3	Input (Active Low)	Configuration Reset. Resets I ² C register space (Active Low). Note upon device startup the RESN pin must be driven low to reset the device registers.
Power Supply			
VCC	2, 7, 13, 20, 26, 30, 35, 41, 52, 58, 64	Power	Power Supply 3.3v±5%
GND	1,4, 10, 17, 23, 29, 38, 44, 49, 55, 61	Ground	
V _{BB}	16	Input	Receiver input biasing voltage
PowerPAD™		Ground	The ground center pad of the package must be connected to GND plane.

AVAILABLE OPTIONS⁽¹⁾

T _A	DESCRIPTION	PACKAGED DEVICE ⁽²⁾
		PAP (64 pin)
-40°C to 85°C	Serial multiplexer	SN65LVCP408

- (1) For the most current package and ordering information, see the Package Option Addendum at the end of this document, or see the TI website at www.ti.com.
- (2) The package is available taped and reeled. Add an R suffix to device types (e.g., SN65LVCP408PAP). Temperature range assumes 1 m/s airflow.

PACKAGE THERMAL CHARACTERISTICS

PACKAGE THERMAL CHARACTERISTICS ⁽¹⁾		NOM	UNIT
θ _{JA} (junction-to-ambient)	100LFM airflow is required otherwise a 4x4 thermal via array must be implemented with 6 layer or greater PCB.	21.2	°C/W

- (1) See application note SPRA953 for a detailed explanation of thermal parameters (<http://www-s.ti.com/sc/psheets/spra953/spra953.pdf>).

ABSOLUTE MAXIMUM RATINGS

 over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		UNIT	
V _{CC}	Supply voltage range ⁽²⁾	–0.5 V to 6 V	
Voltage range		Control inputs, all outputs	–0.5 V to (V _{CC} + 0.5 V)
		Receiver inputs	–0.5 V to 4 V
ESD	Human Body Model ⁽³⁾	All pins	6 kV
	Charged-Device Model ⁽⁴⁾	All pins	500 V
T _J	Maximum junction temperature	See Package Thermal Characteristics Table	
Moisture sensitivity level		2	
Reflow temperature package soldering, 4 seconds		260°C	

- (1) Stresses beyond those listed under absolute maximum ratings may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under recommended operating conditions is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values, except differential I/O bus voltages, are with respect to network ground terminal.
- (3) Tested in accordance with JEDEC Standard 22, Test Method A114-A.
- (4) Tested in accordance with JEDEC Standard 22, Test Method C101.

RECOMMENDED OPERATING CONDITIONS

		MIN	NOM	MAX	UNIT		
dR	Operating data rate			4.25	Gbps		
V _{CC}	Supply voltage	3.135	3.3	3.465	V		
V _{CC(N)}	Supply voltage noise amplitude	10 Hz to 2.125 GHz		20	mV		
T _J	Junction temperature			125	°C		
T _A	Operating free-air temperature ⁽¹⁾	Assumes 4x4 thermal via array is implemented with 6 layer or greater PCB otherwise 100LFM airflow is required.		–40	85	°C	
DIFFERENTIAL INPUTS							
V _{ID}	Receiver peak-to-peak differential input voltage ⁽²⁾	dR _(in) ≤ 4.25 Gbps		100	1750	mV _{PP}	
		1.25 Gbps < dR _(in) ≤ 4.25 Gbps		100	1560	mV _{PP}	
		dR _(in) > 4.25 Gbps		100	1000	mV _{PP}	
V _{ICM}	Receiver common-mode input voltage	Note: for best jitter performance ac coupling is recommended.		1.5	1.6	V _{CC} – $\frac{ V_{ID} }{2}$	V
CONTROL INPUTS							
V _{IH}	High-level input voltage	2		V _{CC} + 0.3	V		
V _{IL}	Low-level input voltage	–0.3		0.8	V		
DIFFERENTIAL OUTPUTS							
R _L	Differential load resistance	80	100	120	Ω		

- (1) Maximum free-air temperature operation is allowed as long as the device maximum junction temperature is not exceeded.
- (2) Differential input voltage V_{ID} is defined as |IN+ – IN–|.

ELECTRICAL CHARACTERISTICS

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP ⁽¹⁾	MAX	UNIT
DIFFERENTIAL INPUTS						
V _{IT+}	Positive going differential input high threshold				50	mV
V _{IT-}	Negative going differential input low threshold		-50			mV
A _(EQ)	Equalizer gain	at 1.875 GHz (EQ=1)		9		dB
R _{T(D)}	Termination resistance, differential		80	100	120	Ω
V _{BB}	Open-circuit Input voltage (input self-bias voltage)	AC-coupled inputs		1.6		V
R _(BBDC)	Biasing network dc impedance			30		kΩ
R _(BBAC)	Biasing network ac impedance	375 MHz		42		Ω
		2.125 GHz		8.4		
DIFFERENTIAL OUTPUTS						
V _{ODH}	High-level output voltage	R _L = 100 Ω ±1%, Pre-Emph=0 dB		650		mV _{PP}
V _{ODL}	Low-level output voltage			-650		mV _{PP}
V _{ODB}	Output differential voltage without preemphasis ⁽²⁾		1000	1300	1500	mV _{PP}
V _{OCM}	Output common mode voltage	See Figure 2		1.8		V
ΔV _{OC(SS)}	Change in steady-state common-mode output voltage between logic states			1		mV
V _(PE)	Output preemphasis voltage ratio, $\frac{V_{ODB(PP)}}{V_{ODPE(PP)}}$	R _L = 100 Ω ±1%; x = L or S; See Figure 3		0		dB
				3		
				6		
				10		
t _(PRE)	Preemphasis duration measurement	Output preemphasis is set to 10 dB during test Measured with a 100-MHz clock signal; R _L = 100 Ω ±1%, See Figure 4		175		ps
r _o	Output resistance	Differential on-chip termination between OUT+ and OUT-		100		Ω
CONTROL INPUTS						
I _{IH}	High-level Input current	VIN = VCC			5	μA
I _{IL}	Low-level Input current	VIN = GND	-125	-90		μA
R _(PU)	Pullup resistance			35		kΩ
POWER CONSUMPTION						
P _D	Device power dissipation	All outputs terminated 100 Ω			1.52	W
P _Z	Device power dissipation in 3-State	All outputs in 3-state	PRBS 2 ⁷⁻¹ pattern at 4.25 Gbps		864	mW
I _{CC}	Device current consumption	All outputs terminated 100 Ω			440	mA

(1) All typical values are at T_A = 25°C and V_{CC} = 3.3 V supply unless otherwise noted. They are for reference purposes and are not production tested.

(2) Differential output voltage V_(ODB) is defined as | OUT+ – OUT- |.

SWITCHING CHARACTERISTICS

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS			MIN	TYP ⁽¹⁾	MAX	UNIT
MULTIPLEXER								
$t_{(SM)}$	Multiplexer switch time	Multiplexer to valid output					15	ns
DIFFERENTIAL OUTPUTS								
t_{PLH}	Low-to-high propagation delay	Propagation delay input to output, See Figure 6				0.5	0.7	ns
t_{PHL}	High-to-low propagation delay					0.5	0.7	ns
t_r	Rise time	20% to 80% of $V_{O(DB)}$; Test Pattern: 100-MHz clock signal; See Figure 5 and Figure 8				90		ps
t_f	Fall time					90		ps
$t_{sk(p)}$	Pulse skew, $ t_{PHL} - t_{PLH} ^{(2)}$						20	ps
$t_{sk(o)}$	Output skew ⁽³⁾	All outputs terminated with 100 Ω				25	75	ps
$t_{sk(pp)}$	Part-to-part skew ⁽⁴⁾						150	ps
t_{zd}	3-State switch time to Disable	Assumes 50 Ω to V_{cm} and 150 pF load on each output; Tested using I2C					30	ns
t_{ze}	3-State switch time to Enable	Assumes 50 Ω to V_{cm} and 150 pF load on each output; Tested using I2C					20	ns
RJ	Device random jitter, rms	See Figure 8 for test circuit. BERT setting 10^{-15} Alternating 10-pattern.				0.8	2	ps-rms
DJ	Intrinsic deterministic device jitter ⁽⁵⁾ , peak-to-peak	0 dB preemphasis See Figure 8 for the test circuit.	PRBS 2^{7-1} pattern	4.25 Gbps			30	ps
	Absolute deterministic output jitter ⁽⁶⁾ , peak-to-peak	0 dB preemphasis See Figure 8 for the test circuit.	PRBS 2^{7-1} pattern	1.25Gbps; EQ=13dB Over 25-inch FR4 trace 4.25 Gbps; EQ=13dB Over FR4 trace 2-inch to 43 inches long		15		ps

- (1) All typical values are at 25°C and with 3.3 V supply unless otherwise noted.
- (2) $t_{sk(p)}$ is the magnitude of the time difference between the t_{PLH} and t_{PHL} of any output of a single device.
- (3) $t_{sk(o)}$ is the magnitude of the time difference between the t_{PLH} and t_{PHL} of any two outputs of a single device.
- (4) $t_{sk(pp)}$ is the magnitude of the difference in propagation delay times between any specified terminals of two devices when both devices operate with the same supply voltages, at the same temperature, and have identical packages and test circuits.
- (5) The SN65LVCP408 built-in passive input equalizer compensates for ISI. For a 25-inch FR4 transmission line with 8-mil trace width, the LVCP408 typically reduces jitter by 29 ps from the device input to the device output.
- (6) Absolute deterministic output jitter reflects the deterministic jitter measured at the SN65LVCP408 output. The value is a real measured value with a Bit error tester as described in [Figure 8](#). The absolute DJ reflects the sum of all deterministic jitter components accumulated over the link: $DJ_{(absolute)} = DJ_{(Signal\ generator)} + DJ_{(transmission\ line)} + DJ_{(intrinsic(LVCP408))}$.

- B. The measurement is made with the AgilentParBert measurement software.

Figure 7. Driver Jitter Measurement Waveforms

For the rise/fall time measurements, the 25-inch FR4 transmission line is removed.

Figure 8. AC Test Circuit — Jitter and Output Rise Time Test Circuit

The SN65LVCP408 input equalizer provides frequency gain to compensate for frequency loss of a shorter backplane transmission line. For characterization purposes, a 25-inch (63,5 cm) FR-4 coupled transmission line is used in place of the backplane trace. The 25-inch trace provides roughly 5 dB of attenuation between 375 MHz and 2.125 GHz, representing closely the characteristics of a short backplane trace. The loss tangent of the FR4 in the test board is 0.018 with an effective $\epsilon(r)$ of 4.1.

I²C CONTROL INTERFACE

I²C Interface Notes

The I²C interface is used to access the internal registers of the SN65LVCP408. I²C is a two-wire serial interface developed by Philips Semiconductor (see I²C-Bus Specification, Version 2.1, January 2000). The bus consists of a data line (SDA) and a clock line (SCL) with pull-up structures. When the bus is idle, both SDA and SCL lines are pulled high. All the I²C compatible devices connect to the I²C bus through open drain I/O pins, SDA and SCL. A master device, usually a microcontroller or a digital signal processor, controls the bus. The master is responsible for generating the SCL signal and device addresses. The master also generates specific conditions that indicate the START and STOP of data transfer. A slave device receives and/or transmits data on the bus under control of the master device. The SN65LVCP408 works as a slave and supports the standard mode transfer (100 kbps).

The basic I²C start and stop access cycles are shown in Figure 19. The basic access cycle consists of the following:

- A start condition
- A slave address cycle
- Any number of data cycles
- A stop condition

Figure 19. I²C Start and Stop Conditions

General I²C Protocol

- The master initiates data transfer by generating a start condition. The start condition is when a high-to-low transition occurs on the SDA line while SCL is high, as shown in Figure 19. All I²C-compatible devices should recognize a start condition.
- The master then generates the SCL pulses and transmits the 7-bit address and the read/write direction bit R/W on the SDA line. During all transmissions, the master ensures that data is valid. A valid data condition requires the SDA line to be stable during the entire high period of the clock pulse (see Figure 20). All devices recognize the address sent by the master and compare it to their internal fixed addresses. Only the slave device with a matching address generates an acknowledge (see Figure 21) by pulling the SDA line low during the entire high period of the ninth SCL cycle. On detecting this acknowledge, the master knows that a communication link with a slave has been established.
- The master generates further SCL cycles to either transmit data to the slave (R/W bit 0) or receive data from the slave (R/W bit 1). In either case, the receiver needs to acknowledge the data sent by the transmitter. So an acknowledge signal can either be generated by the master or by the slave, depending on which one is the receiver. The 9-bit valid data sequences consisting of 8-bit data and 1-bit acknowledge can continue as long as necessary (see Figure 22).
- To signal the end of the data transfer, the master generates a stop condition by pulling the SDA line from low to high while the SCL line is high (see Figure 19). This releases the bus and stops the communication link with the addressed slave. All I²C compatible devices must recognize the stop condition. Upon the receipt of a stop condition, all devices know that the bus is released, and they wait for a start condition followed by a matching address.
- All bytes are transmitted most significant bit first.

Table 1. I²C Timing

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
f _{SCL}	SCL clock frequency for internal register	Local I ² C			100	kHz
t _{W(L)}	Clock LOW period for I ² C register	Local I ² C	4.7			μs
t _{W(H)}	Clock HIGH period for internal register	Local I ² C	4			μs
t _{SU1}	Internal register setup time, SDA to SCL	Local I ² C	250			μs
t _{h(1)}	Internal register hold time, SCL to SDA	Local I ² C	0			μs
t _(buf)	Internal register bus free time between STOP and START	Local I ² C	4.7			μs
t _{SU(2)}	Internal register setup time, SCL to START	Local I ² C	4.7			μs
t _{h(2)}	Internal register hold time, START to SCL	Local I ² C	4			μs
t _{SU(3)}	Internal register hold time, SCL to STOP	Local I ² C	4			μs

Figure 20. I²C Bit Transfer

Figure 21. I²C Acknowledge

Note: Following power up, this device must be reset.

Figure 22. I²C Address and Data Cycles

During a write cycle, the slave sends an acknowledge (A) after every byte that follows the device address. The first byte following the device address is the register address, which maps to the register addresses specific to the device. The second byte following the device address is the data byte to be written at the register address (see Figure 23). If only the register address is to be written for a subsequent read sequence, the data byte is omitted and the sequence ends with a Stop (see Figure 24) or a repeated Start after the register address byte (see Figure 26). If multiple data bytes are to be written at subsequent register addresses, the master may continue to send data bytes after each slave acknowledge, and the slave device automatically increments the register address. Note that the master must not drive the SDA signal line during the slave acknowledge since the slave is in control of the SDA bus and may be holding it low.

During a read cycle, the slave acknowledges the initial address byte if it decodes the device address as its own device address. Following this initial acknowledge by the slave, the master device becomes a receiver and acknowledges data bytes sent by the slave. The first byte received by the master is the data stored at the register address, while subsequent bytes are data stored at incrementing register addresses. When the master has received all of the requested data bytes from the slave, the not acknowledge (A) condition is initiated by the master by keeping the SDA signal high just before it asserts the Stop (P) condition. This sequence terminates a read cycle as shown in Figure 25. A combined format is when the read cycle is preceded by a write cycle for setting the register address, and is shown in Figure 26.

Figure 23. I²C Write Cycle with Register Address and Data

Figure 24. I²C Write Cycle with Register Address Only

Figure 25. I²C Read Cycle

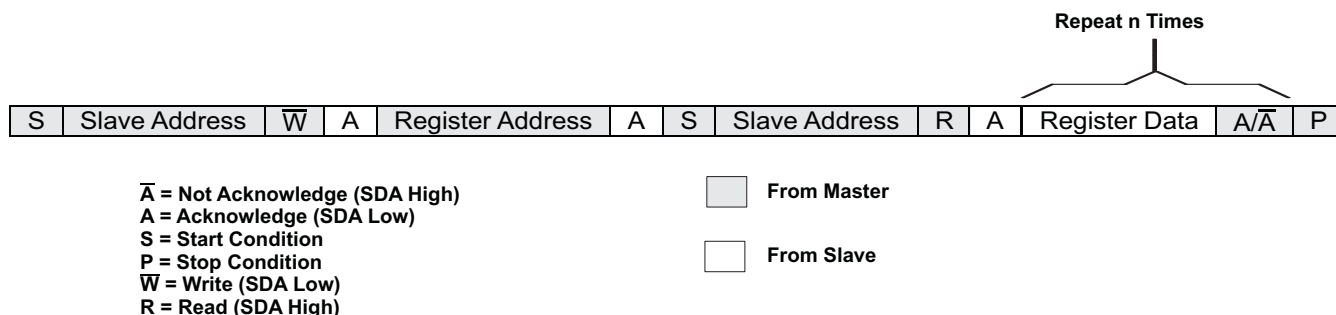

Figure 26. I²C Combined Format Write/Read Cycle

Slave Address

Both SDA and SCL must be connected to a positive supply voltage via a pull-up resistor. These resistors should comply with the I²C specification that ranges from 2 kΩ to 19 kΩ. When the bus is free, both lines are high. The slave address is the first 7 bits received following the START condition from the master device. The first 5 Bits (MSBs) of the address are factory preset to 01011. The next two bits of the SN65LVCP408 address are controlled by the logic levels appearing on the ADDR2 and ADDR1 pins. The ADDR2 and ADDR1 address inputs can be connected to VCC for logic 1, GND for logic 0, or can be actively driven by TTL/CMOS logic levels. The device addresses are set by the state of these pins and are not latched. Thus a dynamic address control system could be utilized to incorporate several devices on the same system. Up to four SN65LVCP408 devices can be connected to the same I²C-Bus without requiring additional glue logic. Table 2 lists the possible addresses for the SN65LVCP408.

Table 2. Slave Addresses

Fixed Address					Selectable with Address Pins	
Bit 6 (MSB)	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1(addr2)	Bit 0 (addr1)
0	1	0	1	1	0	0
0	1	0	1	1	0	1
0	1	0	1	1	1	0
0	1	0	1	1	1	1

Note: Following power up, this device must be reset.

Switching Options

For each output port, users can select two possible input port selection profiles (i.e. sources that indicate which input port to use for the output). Input port select No. 1 I²C™ register bits are used to select the configuration of each output port that is used for default operation. (Note: on power up and after resetting the I2C register space with the RESN pin, each output port is mapped to its matching input port. For example, output port 0 is mapped to input port 0, and output port 1 is mapped to input port 1, etc.). Input Port Select No. 2 registers are used to select the secondary output port configuration that is used when the switch event is triggered.

Triggering Switch Event

Switching between the active output port configuration and the secondary output port configuration (configuration selected with Input Port Select No 2 registers) is accomplished in two ways:

1. The switch event can be triggered using the I²C register bit Switch Via I²C and setting it to 1 (high).
2. If the switch event needs to occur faster than the I²C access allows, then users have the option to use the SWT pin (pin #62) to trigger the switch from port configuration No. 1 to port configuration No. 2. For this option, users should set the Enable Switch Via I²C register bit to 1 upon initial start up. The SWT pin should be logic high state to initiate the switch. Changing the logic states of the SWT pin causes the port configurations to move between the two port configuration options.

APPLICATION INFORMATION

BANDWIDTH REQUIREMENTS

Error free transmission of data over a transmission line has specific bandwidth demands. It is helpful to analyze the frequency spectrum of the transmit data first. For an 8B10B coded data stream at 3.75 Gbps of random data, the highest bit transition density occurs with a 1010 pattern (1.875 GHz). The least transition density in 8B10B allows for five consecutive ones or zeros. Hence, the lowest frequency of interest is 1.875 GHz/5 = 375 MHz. Real data signals consist of higher frequency components than sine waves due to the fast rise time. The faster the rise time, the more bandwidth becomes required. For 80-ps rise time, the highest important frequency component is at least $0.6/(\pi \times 80 \text{ ps}) = 2.4 \text{ GHz}$. [Figure 27](#) shows the Fourier transformation of the 375-MHz and 1.875-GHz trapezoidal signal.

Figure 27. Approximate Frequency Spectrum of the Transmit Output Signal With 80 ps Rise Time

The spectrum analysis of the data signal suggests building a backplane with little frequency attenuation up to 2 GHz. This is achievable only with expensive, specialized PCB material. To support material like FR4, a compensation technique is necessary to compensate for backplane imperfections.

EXPLANATION OF EQUALIZATION

Backplane designs differ widely in size, layer stack-up, and connector placement. In addition, the performance is impacted by trace architecture (trace width, coupling method) and isolation from adjacent signals. Common to most commercial backplanes is the use of FR4 as board material and its related high-frequency signal attenuation. Within a backplane, the shortest to longest trace lengths differ substantially – often ranging from 8 inches up to 40 inches. Increased loss is associated with longer signal traces. In addition, the backplane connector often contributes a good amount of signal attenuation. As a result, the frequency signal attenuation for a 300-MHz signal might range from 1 dB to 4 dB while the corresponding attenuation for a 2-GHz signal might span 6 dB to 24 dB. This frequency dependent loss causes distortion jitter on the transmitted signal. Each LVCP408 receiver input incorporates an equalizer and compensates for such frequency loss. The SN65LVCP408 equalizer provides 5 dB of frequency gain between 375 MHz and 1.875 GHz, compensating roughly for 20 inches of FR4 material with 8-mil trace width. Distortion jitter improvement is substantial, often providing more than 30-ps jitter reduction. The 5-dB compensation is sufficient for most short backplane traces. For longer trace lengths, it is recommended to enable transmit preemphasis in addition.

SETTING THE PREEMPHASIS LEVEL

The receive equalization compensates for ISI. This reduces jitter and opens the data eye. In order to find the best preemphasis setting for each link, calibration of every link is recommended. Assuming each link consists of a transmitter (with adjustable pre-emphasis such as LVCP408) and the LVCP408 receiver, the following steps are necessary:

1. Set the transmitter and receiver to 0-dB preemphasis; record the data eye on the LVCP408 receiver output.
2. Increase the transmitter preemphasis until the data eye on the LVCP408 receiver output looks the cleanest.

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBsolete: TI has discontinued the production of the device.

⁽²⁾ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

⁽³⁾ MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

THERMAL PAD MECHANICAL DATA

PAP (S-PQFP-G64)

PowerPAD™ PLASTIC QUAD FLATPACK

THERMAL INFORMATION

This PowerPAD™ package incorporates an exposed thermal pad that is designed to be attached to a printed circuit board (PCB). The thermal pad must be soldered directly to the PCB. After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For additional information on the PowerPAD package and how to take advantage of its heat dissipating abilities, refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 and Application Brief, PowerPAD Made Easy, Texas Instruments Literature No. SLMA004. Both documents are available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

4206326-3/M 09/10

NOTES: A. All linear dimensions are in millimeters

 Tie strap features may not be present.

PAP (S-PQFP-G64)

PowerPAD™ PLASTIC QUAD FLATPACK

- NOTES:
- All linear dimensions are in millimeters.
 - This drawing is subject to change without notice.
 - Customers should place a note on the circuit board fabrication drawing not to alter the center solder mask defined pad.
 - This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002, SLMA004, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <<http://www.ti.com>>. Publication IPC-7351 is recommended for alternate designs.
 - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Example stencil design based on a 50% volumetric metal load solder paste. Refer to IPC-7525 for other stencil recommendations.
 - Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
