

LM48861

LM48861 *Ground-Referenced, Ultra Low Noise, Stereo Headphone
Amplifier*

Literature Number: SNAS450A

Ground-Referenced, Ultra Low Noise, Stereo Headphone Amplifier

General Description

The LM48861 is a single supply, ground-referenced stereo headphone amplifier. Part of National's PowerWise® product family, the LM48861 consumes only 3mW of power, yet still provides great audio performance. The ground-referenced architecture eliminates the larger DC blocking capacitors required by traditional headphone amplifier's saving board space and reducing cost.

The LM48861 features common-mode sensing that corrects for any differences between the amplifier ground and the potential at the headphone return terminal, minimizing noise created by any ground mismatches.

The LM48861 delivers 22mW/channel into a 32Ω load with <1% THD+N with a 1.8V supply. Power supply requirements allow operation from 1.2V to 2.8V. High power supply rejection ratio (PSRR), 83dB at 217Hz, allows the device to operate in noisy environments without additional power supply conditioning. A low power shutdown mode reduces supply current consumption to 0.01μA.

Superior click and pop suppression eliminates audible transients on power-up/down and during shutdown. The LM48861 is available in an ultra-small 12-bump, 0.4mm pitch, micro SMD package (1.215mm x 1.615mm).

Key Specifications

- Output Power/channel at
 $V_{DD} = 1.5V$, THD+N = 1%
 $R_L = 16\Omega$ 12mW (typ)
 $R_L = 32\Omega$ 13mW (typ)
- Output Power/channel at
 $V_{DD} = 1.8V$, THD+N = 1%
 $R_L = 16\Omega$ 24mW (typ)
 $R_L = 32\Omega$ 22mW (typ)
- Quiescent Power Supply Current
 at 1.5V 2mA (typ)
- PSRR at 217Hz 83dB (typ)
- Shutdown Current 0.01μA (typ)

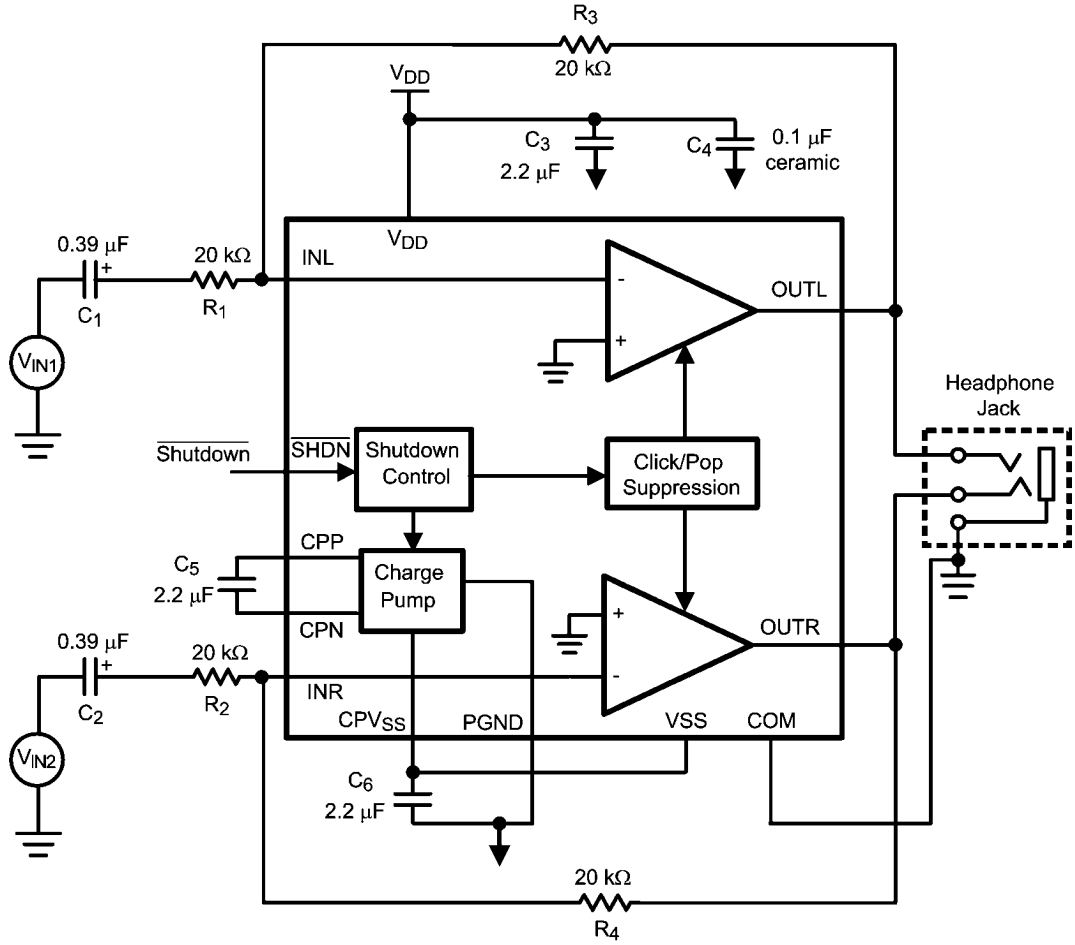

Features

- Ground referenced outputs – eliminates output coupling capacitors
- Common-mode sensing
- Advanced click-and-pop suppression
- Low supply current
- Minimum external components
- Micro-power shutdown
- ESD protection of 8kV HBM contact
- Available in space-saving 12-bump microSMD package

Applications

- Mobile Phones
- Portable electronic devices
- MP3 Players

Typical Application

300541a9

C-P	Click-Pop	Inputs Grounded BW = <10Hz to >500kHz	79		dB

Note 1: "Absolute Maximum Ratings" indicate limits beyond which damage to the device may occur, including inoperability and degradation of device reliability and/or performance. Functional operation of the device and/or non-degradation at the *Absolute Maximum Ratings* or other conditions beyond those indicated in the *Recommended Operating Conditions* is not implied. The *Recommended Operating Conditions* indicate conditions at which the device is functional and the device should not be operated beyond such conditions. All voltages are measured with respect to the ground pin, unless otherwise specified

Note 2: The *Electrical Characteristics* tables list guaranteed specifications under the listed *Recommended Operating Conditions* except as otherwise modified or specified by the *Electrical Characteristics Conditions* and/or Notes. Typical specifications are estimations only and are not guaranteed.

Note 3: Maximum allowable power dissipation is $P_{DMAX} = (T_{JMAX} - T_A) / \theta_{JA}$ or the number given in *Absolute Maximum Ratings*, whichever is lower.

Note 4: Human body model, applicable std. JESD22-A114C.

Note 5: Machine model, applicable std. JESD22-A115-A.

Note 6: Typical values represent most likely parametric norms at $T_A = +25^\circ\text{C}$, and at the *Recommended Operation Conditions* at the time of product characterization and are not guaranteed.

Note 7: Datasheet min/max specification limits are guaranteed by test or statistical analysis.

Application Information

GENERAL AMPLIFIER FUNCTION

The LM48861 headphone amplifier features National's ground referenced architecture that eliminates the large DC-blocking capacitors required at the outputs of traditional headphone amplifiers. A low-noise inverting charge pump creates a negative supply (CPV_{SS}) from the positive supply voltage (V_{DD}). The headphone amplifiers operate from these bipolar supplies, with the amplifier outputs biased about GND, instead of a nominal DC voltage (typically V_{DD}/2), like traditional amplifiers. Because there is no DC component to the headphone output signals, the large DC-blocking capacitors (typically 220µF) are not necessary, conserving board space and system cost, while improving frequency response.

COMMON MODE SENSE

The LM48861 features a ground (common mode) sensing feature. In noisy applications, or where the headphone jack is used as a line out to other devices, noise pick up and ground imbalance can degrade audio quality. The LM48861 COM input senses and corrects any noise at the headphone return, or any ground imbalance between the headphone return and device ground, improving audio reproduction. Connect COM directly to the headphone return terminal of the headphone jack (Figure 2). No additional external components are required. Connect COM to GND if the common-mode sense feature is not in use.

FIGURE 2.

MICRO POWER SHUTDOWN

The voltage applied to the shutdown ($\overline{\text{SHDN}}$) pin controls the LM48861's shutdown function. Activate micro-power shutdown by applying a logic-low voltage to the $\overline{\text{SHDN}}$ pin. When active, the LM48861's micro-power shutdown feature turns off the amplifier's bias circuitry, reducing the supply current. The trigger point is 0.4V (max) for a logic-low level, and 1.4V (min) for a logic-high level. The low 0.1µA (typ) shutdown current is achieved by applying a voltage that is as near as ground as possible to the $\overline{\text{SHDN}}$ pin. A voltage that is higher than ground may increase the shutdown current.

There are a few ways to control the micro-power shutdown. These include using a single-pole, single-throw switch, a microprocessor, or a microcontroller. When using a switch, connect an external 100kΩ pull-up resistor between the $\overline{\text{SHDN}}$ pin and GND. Connect the switch between the $\overline{\text{SHDN}}$ pin and V_{DD}. Select normal amplifier operation by closing the switch. Opening the switch connects the $\overline{\text{SHDN}}$ pin to ground, activating micro-power shutdown. The switch and resistor guarantee that the $\overline{\text{SHDN}}$ pin will not float. This prevents unwanted state changes. In a system with a microprocessor or microcontroller, use a digital output to apply the control

voltage to the $\overline{\text{SHDN}}$ pin. Driving the $\overline{\text{SHDN}}$ pin with active circuitry eliminates the pull-up resistor.

POWER DISSIPATION

Power dissipation is a major concern when using any power amplifier, especially one in mobile devices. In the LM48861, the power dissipation comes from the charge pump and two operational amplifiers. Refer to the Power Dissipation vs Output Power curve in the Typical Performance Characteristics section of the datasheet to find the power dissipation associated the output power level of the LM48861. The power dissipation should not exceed the maximum power dissipation point of the micro SMD package given in equation 1.

$$P_{\text{DMAX}} = (T_{\text{JMAX}} - T_{\text{A}}) / (\theta_{\text{JA}}) \quad (1)$$

For the LM48861TM micro SMD package, $\theta_{\text{JA}} = 70^{\circ}\text{C}/\text{W}$, $T_{\text{JMAX}} = 150^{\circ}\text{C}$, and T_{A} is the ambient temperature of the system surroundings.

PROPER SELECTION OF EXTERNAL COMPONENTS

Power Supply Bypassing/Filtering

Proper power supply bypassing is critical for low noise performance and high PSRR. Place the supply bypass capacitors as close to the supply pins as possible. Place a 1µF ceramic capacitor from V_{DD} to GND. Additional bulk capacitance may be added as required.

Charge Pump Capacitor Selection

Use low ESR ceramic capacitors (less than 100mΩ) for optimum performance.

Charge Pump Flying Capacitor (C5)

The flying capacitor (C5) affects the load regulation and output impedance of the charge pump. A C5 value that is too low results in a loss of current drive, leading to a loss of amplifier headroom. A higher valued C5 improves load regulation and lowers charge pump output impedance to an extent. Above 2.2µF, the R_{DS(ON)} of the charge pump switches and the ESR of C5 and C6 dominate the output impedance. A lower value capacitor can be used in systems with low maximum output power requirements.

Charge Pump Hold Capacitor (C6)

The value and ESR of the hold capacitor (C6) directly affects the ripple on CPV_{SS}. Increasing the value of C6 reduces output ripple. Decreasing the ESR of C6 reduces both output ripple and charge pump output impedance. A lower value capacitor can be used in systems with low maximum output power requirements.

Power Supply Bypassing /Filtering

Proper power supply bypassing is critical for low noise performance and high PSRR. Place the supply bypass capacitors as close to the device as possible. Typical applications employ a voltage regulator with 10µF and 0.1µF bypass capacitors that increase supply stability. These capacitors do not eliminate the need for bypassing of the LM48861 supply pins. A 1µF capacitor is recommended.

Input Capacitor Selection

The LM48861 requires input coupling capacitors. Input capacitors block the DC component of the audio signal, eliminating any conflict between the DC component of the audio source and the bias voltage of the LM48861. The input capacitors create a high-pass filter with the input resistors R_{IN}.

The -3dB point of the high-pass filter is found using Equation (2) below.

$$f = 1 / 2\pi R_{IN} C_{IN} \quad (2)$$

Where the value of R_{IN} is selected based on the gain-setting resistor selection. In relation to Figure 1, $R_{IN} = R1 = R2$, $C_{IN} = C1 = C2$.

The input capacitors can also be used to remove low frequency content from the audio signal. Small speakers can not reproduce, and may even be damaged by low frequencies. High-pass filtering the audio signal helps protect the speakers. When the LM48861 is using a single-ended source, power supply noise on the ground is seen as an input signal. Setting the high-pass filter point above the power supply noise frequencies, 217Hz in a GSM phone, for example, filters out the noise such that it is not amplified and heard on the output. Capacitors with a tolerance of 10% or better are recommended for impedance matching and improved CMRR and PSRR.

PCB Layout Guidelines

Minimize trace impedance of the power, ground and all output traces for optimum performance. Voltage loss due to trace resistance between the LM48861 and the load results in decreased output power and efficiency. Trace resistance between the power supply and ground has the same effect as a poorly regulated supply, increased ripple and reduced peak output power. Use wide traces for power supply inputs and amplifier outputs to minimize losses due to trace resistance, as well as route heat away from the device. Proper grounding improves audio performance, minimizes crosstalk between channels and prevents switching noise from interfering with the audio signal. Use of power and ground planes is recommended.

As described in the Common Mode Sense section, the LM48861 features a ground sensing feature. On the PCB layout, connect the COM pin (pin D2) directly to the headphone jack ground and also to the left and right input grounds. This will help correct any noise or any ground imbalance between the headphone return, input, and the device ground, therefore improving audio reproduction.

The charge pump capacitors and traces connecting the capacitor to the device should be kept away from the input and output traces to avoid any switching noise injected into the input or output.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
