Evaluation Board for the LMH2100 Logarithmic Power Detector

National Semiconductor
Application Note 1761
Ger Rietveld
December 14, 2007

General Description

This evaluation board is designed to aid in the characterization of National Semiconductors LMH2100 Logarithmic Power Detector. This board simplifies the measurement of the DC output voltage that the LMH2100 produces in response to the power level of the RF signal applied to the RF input. Use the evaluation board as a guide for high frequency layout and as a tool to aid in device testing and characterization.

FIGURE 1. LMH2100 Evaluation Board

Basic Operation

The LMH2100 is a 40 dB RF Logarithmic power detector intended for use in CDMA and WCDMA applications. The device has an RF frequency range from 50 MHz to 4 GHz. It provides an accurate temperature and supply compensated output voltage that relates linearly to the RF input power in dBm. The circuit operates with a single supply form 2.7V to 3.3V and has an RF power detection range from -45 dBm to -5 dBm. The board consist of a single LMH2100 along with external components soldered on a printed circuit board. Figure 2 shows the schematic of the LMH2100 evaluation board.

External supply voltages and input signals can be applied to the onboard connectors. The supply voltage is applied with connectors P2.2 (V_{DD}) and P2.1 (GND). The RF input signal is applied by SMA connector P1. This RF signal is applied through an RF generator and is connected with a 50 Ω coax cable. The detector output can be measured via BNC connector P3.

FIGURE 2. Evaluation Board Schematic

The device can be activated by forcing a “high” voltage to the enable input. This can be done by jumper J4.

Jumper J4	Device	
V_{DD}		Active
EN	$V_{EN} = \text{high}$	Active
	$V_{EN} = \text{low}$	Shutdown
GND		Shutdown

The REF input (P4) is directly connected to the inverting input of the transimpedance amplifier in the LMH2100 and can be used to compensate for the temperature drift of the internal reference voltage.

Capacitors C_3 , C_4 , C_5 , and C_6 are decoupling capacitors and will act as RF shorts to prevent RF interference.

Additional low-pass filtering of the output signal can be realized by means of an external resistor (R_3) and capacitor (C_2). For more details about filtering, check the application information in the LMH2100 datasheet.

Layout Considerations

As with any other RF device, careful attention must be paid to the board layout. If the board layout is not properly designed, unwanted signals will be detected or interference will be picked up. Electrical signals (voltage/currents) need a finite time to travel through a trace or transmission line. RF voltage levels at the generator side and at the detector side can therefore be different. This is not true for the RF strip line, but is true for all traces on the PCB. Signals at different locations or traces on the PCB will be in different phase of the RF frequency cycle. Phase differences in, for example the voltage across neighboring lines, may result in crosstalk between lines, due to parasitic capacitance or inductive coupling. The crosstalk is further enhanced by the fact that all traces on the PCB are susceptible to resonance. The resonance frequency depends on the trace geometry. Traces are particularly sensitive to interference when the length of the trace corresponds to a quarter of the wavelength of the interfering signal or a multiple thereof.

SUPPLY LINES

Since the PSRR of the LMH2100 is finite, variations of the supply can result in some variation at the output. This can be caused by RF injection from other parts of the circuitry or on/off switching of the PA or other various issues.

POSITIVE SUPPLY (V_{DD})

In order to minimize injection of the RF interference into the LMH2100 through the supply lines, the PCB traces connecting to V_{DD} and GND should be shorted for RF. This can be done by placing a small decoupling capacitor between the V_{DD} and GND. It should be placed as close as possible to the V_{DD} and GND pins of the LMH2100 as indicated in Figure 3. The resonance frequency of the capacitor itself should be above the highest RF frequency used in the application, since the capacitance acts as an inductor used above its resonance frequency.

30046202

FIGURE 3. Recommended Board Layout

Low frequency supply voltage variations due to PA switching might result in a ripple at the output voltage. The LMH2100 has a Power Supply Rejection Ratio of 60 dB for low frequencies.

GROUND (GND)

The LMH2100 needs a ground plane free of noise and other disturbing signals. It is important to separate the RF ground return path from the other grounds. This is due to the fact that the RF input handles large voltage swings. A power level of 0 dBm will cause a voltage swing larger than $0.6 V_{pp}$, over the internal 50Ω input resistor. This will result in a significant RF return current towards the source. It is therefore recommended that the RF ground return path is not used for other circuits in the design. The RF path should be routed directly back to the source without loops.

RF INPUT INTERFACE (RF_{IN})

The LMH2100 is designed to be used in RF applications that have a characteristic impedance of 50Ω . To achieve this impedance, the input of the LMH2100 needs to be connected via a 50Ω transmission line. Transmission lines can be easily created on PCBs using microstrip or (grounded) coplanar waveguide configurations. Both configurations are discussed in more detail in the application information of the LMH2100 datasheet or in microwave designer handbooks.

REFERENCE (REF)

The reference pin can be used to compensate for temperature drift of the internal reference voltage of the LMH2100. The

REF pin is directly connected to the inverting input of the transimpedance amplifier. Thus, RF signals and other spurious signals couple directly through to the output. Introduction of RF signals into the REF pin can be prevented by connecting a small capacitor (C_6) between the REF pin and ground. The capacitor should be placed as close to the REF pin as possible.

OUTPUT (OUT)

The OUT pin is sensitive to crosstalk from the RF input, especially at high power levels. The ESD diode between the output and V_{DD} may rectify the RF signal, but may not add an unwanted inaccurate DC component to the output voltage. The board layout should minimize crosstalk between the detector's input RF_{IN} and the detector's output. Using an additional capacitor (C_4) connected between the output and the positive supply voltage V_{DD} pin or GND can prevent this. For optimal performance this capacitor should be placed as close as possible to the OUT pin of the LMH2100.

FIGURE 4. Layout of the Evaluation Board

The Bill of Material (BOM) of the evaluation board is given in the table below.

Designator	Description	Comment
R1	0603 Resistor	100 k Ω
R2	0603 Resistor	100 k Ω
R3	0603 Resistor	NU
C1	0603 Capacitor	10n
C2	0603 Capacitor	NU
C3	0201 Capacitor	10p
C4	0201 Capacitor	10p
C5	0201 Capacitor	1p
C6	0603 Capacitor	10p
J4	Jumper	Header 2x3
P1	Connector	SMA
P2.1	Connector	banana socket
P2.2	Connector	banana socket
P3	Connector	BNC-RA
P4	Connector	BNC-RA
P5	Connector	BNC-RA
U1	6-Bump micro SMD	LMH2100

Measurement Procedure

The performance of the LMH2100 can be measured with the setup given in *Figure 5*.

FIGURE 5. Measurement Setup

An external power supply provides a voltage of 2.7V to 3.3V to the evaluation board. An accurate and stable RF Signal Generator is used to produce a test signal. Be sure to use low loss coax cables to ensure reliable measurement data. The detected output voltage can be measured with a Digital Voltage Meter (DVM). To make continuous measurements place a jumper from V_{DD} to enable (EN).

Measurement Results

Figure 6 shows the frequency response of the LMH2100 at various RF input power levels

FIGURE 6. V_{OUT} vs. RF Input Frequency

Figure 7 shows the detector response for an RF input power sweep at various frequencies.

FIGURE 7. V_{OUT} vs. RF Input power level

LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS PRIOR WRITTEN APPROVAL OF THE CHIEF EXECUTIVE OFFICER AND GENERAL COUNSEL OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

Life support devices or systems are devices which (a) are intended for surgical implant into the body, or (b) support or sustain life and whose failure to perform when properly used in accordance with instructions for use provided in the labeling can be reasonably expected to result in a significant injury to the user. A critical component is any component in a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system or to affect its safety or effectiveness.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
