

16-Bit Low-Power Stereo Audio ADC With Microphone Bias and Microphone Amplifier

FEATURES

- Analog Front End:
 - Stereo Single End Input With MUX
 - Mono Differential Input
 - Stereo Programmable Gain Amplifier
 - Microphone Boost Amplifier and Bias
- Analog Performances Dynamic Range: 90 dB
- Power-Supply Voltage
 - 1.71 V to 3.6 V for Digital I/O Section
 - 1.71 V to 3.6 V for Digital Core Section
 - 2.4 V to 3.6 V for Analog Section
- Low Power Dissipation:
 - 13 mW in Record, 1.8/2.4 V, 48 kHz, Stereo
 - 5.3 mW in Record, 1.8/2.4 V, 8 kHz, Mono
 - 3.3 μW in All Power Down
- Sampling Frequency: 5 kHz to 50 kHz
- Auto Level Control for Recording
- Operation by Single Clock Input Without PLL
- System Clock: Common Audio Clock (256 f_s/384 f_s), 12/24, 13/26, 13.5/27, 19.2/38.4, 19.68/39.36 MHz
- 2 (I²C) or 3 (SPI) Wire Serial Control
- Programmable Function by Register Control:
 - Digital Soft Mute
 - Power Up/Down Control for Each Module
 - 30-dB to -12-dB Gain for Analog Inputs
 - 0/12/20-dB Boost for Microphone Input
 - Parameter Settings for ALC
 - Three-Band Tone Control and 3D Sound
 - High-Pass Filter and Two-Stage Notch Filter
- Pop Noise Reduction Circuit

- Package:
 - 24-QFN (4 mm imes 5 mm)
 - 24-DSBGA (2.49 mm × 3.49 mm)
- Operation Temperature Range: -40°C to 85°C

APPLICATIONS

- Portable Audio Player, Cellular Phone
- Video Camcorder, Movie Digital Still Camera
- PMP/DMB, Voice Recorder

DESCRIPTION

The PCM1870 is a low-power stereo ADC designed for portable digital audio applications, with line-input amplifier, microphone amplifier, boost bias. programmable gain control, sound effects, and auto level control (ALC). It is available in 24-QFN (4-mm \times 5-mm) and 24-DSBGA (2.49-mm \times 3.49-mm) packages to save footprint. The PCM1870 accepts right-justified, left-justified, l²S, and DSP formats, providing easy interfacing to audio DSP and encoder chips. Sampling rates up to 50 kHz are supported. The user-programmable functions are accessible through a 2- or 3-wire serial control port.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

PCM1870

SLAS544A-MAY 2007-REVISED SEPTEMBER 2007

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

ABSOLUTE MAXIMUM RATINGS

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		PCM1870	UNIT
V_{DD}, V_{IO}, V_{CC}	Supply voltage	-0.3 to 4	V
	Ground voltage differences: DGND, AGND, PGND	±0.1	V
	Input voltage	-0.3 to 4	V
	Input current (any pins except supplies)	±10	mA
	Ambient temperature under bias	-40 to 110	°C
	Storage temperature	-55 to 150	°C
	Junction temperature	150	°C
	Lead temperature (soldering)	260 / 5	°C / s
	Package temperature (reflow, peak)	260	°C

(1) Stresses beyond those listed under absolute maximum ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicted under recommended operating conditions is not impled. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

PCM1870 DESCRIPTION

Analog Input

The AIN1L, AIN1R, AIN2L and AIN2R pins can be used as microphone or line inputs with selectable 0- or 20-dB boost and 1-Vrms input. All analog inputs have high input impedance (20 k Ω), which is not changed by gain settings. One pair of inputs is selected by register 87 (AIL[1:0], AIR[1:0]). AIN1L and AIN1R can also be used as a monaural differential input.

Gain Setting for Analog Input

Analog signals can be adjusted from 30 dB to -12 dB in 1-dB steps after the 0-, 12- or 20-dB boost amplifier. Gain level can be set for each channel by register 79, 80 (ALV[5:0], ARV[5:0]).

A/D Converter

The ADC includes a multilevel delta-sigma modulator, aliasing filter, decimation filter, high-pass filter and notch filter and can accept 1 Vrms as full-scale input voltage. The decimation filter has a digital soft mute controlled by register 81 (RMUL, RMUR), and the high-pass and notch filters can be disabled by register 81 (HPF[1:0]) and registers 96 through 104 if they are not needed to cancel dc offset or avoid wind noise.

Common Voltage

Unbuffered common voltage. The V_{COM} pin is normally biased to 0.5 V_{CC} , and it provides common voltage to internal circuitry. Connecting a 4.7- μ F capacitor to this pin is recommended to optimize analog performance.

Microphone Bias

The MICB pin is a microphone bias source for an external microphone, which can provide 2 mA (typ) bias current.

Auto Level Control (ALC) for Recording

The sound when microphone recording should be adjusted to a suitable level without saturation. The digitally controlled auto level control (ALC) automatically expands small input signals and compresses large input signals while recording. Expansion level, compression level, attack time, and recovery time can be selected by register 83. See the bit descriptions of register 83 for detailed settings.

3D Sound

A 3D sound effect is provided by mixing L-channel and R-channel data through a band-pass filter with two control parameters, mixing ratio and band-pass filter characteristic. The control parameters are set in register 95 (3DP[3:0], 3FLO). The 3D sound effect is applied to the ADC digital output.

3-Band Tone Control

Tone control has bass, midrange, and treble controls that can be adjusted from 12 dB to -12 dB in 1-dB steps by register 92 to 94 (LGA[4:0], MGA[4:0] and HGA[4:0]). Register 92 (LPAE), which attenuates the digital input signal automatically, can prevent clipping of the output signal at settings higher than 0 dB for bass control. LPAE is not effective for midrange and treble control.

High-Pass Filter and Notch Filter

The high-pass filter cuts dc offset in the analog section of the ADC and can be set to 4 Hz, 120 Hz, or 240 Hz at 48-kHz sampling by register 81 (HPF[1:0]).

Notch filters remove noise at particular frequencies, CCD noise, motor noise and other mechanical noise in an application. The PCM1870 has two notch filters, whose center frequency and frequency bandwidth can be programmed by registers 96 to 104.

Digital Monaural Mixing

The audio data can be mixed to monaural digital data from stereo digital data in the internal audio interface section by register 96 (MXEN).

Zero-Cross Detection

Zero-cross detection minimizes audible zipper noise while changing analog volume and digital attenuation. This function can be applied to digital input or digital output by register 86 (ZCRS).

Power Up/Down for Each Module

Using register 73 (PBIS), register 82 (PAIR, PAIL, PADS, PMCB, PADR, PADL), and register 90 (PCOM), unused modules can be powered down to minimize power consumption (13 mW when recording only).

Digital Interface

All digital I/O pins can interface at various power supply voltages. The V_{IO} pin can be connected to a 1.71-V to 3.6-V power supply.

Power Supply

The V_{CC} pin can be connected to 2.4 V to 3.6 V. The V_{DD} pin and V_{IO} pin can be connected to 1.71 to 3.6 V. A different voltage can be applied to each of these pins (for example, $V_{DD} = 1.8$ V, $V_{IO} = 3.3$ V).

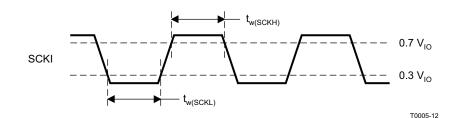

DESCRIPTION OF OPERATION

System Clock Input

The PCM1870 can accept input clocks of various frequencies without a PLL. The clocks are used for clocking of the digital filters, auto level control, and delta-sigma modulators, and classified into common-audio and application-specific clocks. Table 2 shows frequencies of the common audio clock and the application-specific clock. Figure 13 shows timing requirements for system clock inputs. The sampling rate and frequency of the system clock are determined by settings in register 86 (MSR[2:0]) and register 85 (NPR[5:0]). Note that the sampling rate of the application-specific clock has a little sampling error. The details are shown in Table 8.

Table 2. Frequency of Common Audio Clock

	FREQUENCY
Common audio clock	11.2896, 12.288, 16.9344, 18.432 MHz
Application-specific clock	12, 13, 13.5, 24, 26, 27, 19.2, 19.68, 38.4, 39.36 MHz

PARAMETERS	SYMBOL	MIN	UNIT
System clock pulse duration, high	t _{w(SCKH)}	14	ns
System clock pulse duration, low	t _{w(SCKL)}	14	ns

Figure 13. System Clock Timing

Power-On Reset and System Reset

The power-on-reset circuit outputs reset signal, typically at $V_{DD} = 1.2$ V, and this circuit does not depend on the voltage of other power-supplies (V_{CC} , V_{PA} , and V_{IO}). Internal circuits are cleared to default status, then signals are removed from all analog and digital outputs. The PCM1870 does not require any power supply sequencing. Register data must be written after turning all power supplies on.

System reset is enabled by setting register 85 (SRST), and all registers are cleared automatically. All circuits are reset to their default status at once. Note that the PCM1870 has audible pop noise on the analog outputs when enabling SRST.

Power On/Off Sequence

To reduce audible pop noise, a sequence of register settings is required after turning all power supplies on when powering up, or before turning the power supplies off when powering down. If some modules are not required for a particular application or operation, they should be placed in the power-down state after performing the power-on sequence. The recommended power-on and power-off sequences are shown in Table 3 and Table 4, respectively.

Table 3. Recommended Power-On Sequence

STEP	REGISTER SETTINGS	NOTE
1	—	Turn ON all power supplies ⁽¹⁾
2	5102 _H	ADC audio interface format (left-justified) (2)
3	5A00 _H	PG1, PG2 gain control (0 dB)
4	4980 _H	Analog bias power up
5	5601 _H	Zero-cross detection enable
6	4A01 _H	V _{COM} power up
7	523F _H	Analog front end (ADL, ADR, D2S, MCB, PG1, 2, 5, 6) power up
8	5711 _H	Analog input (MUX3, MUX4) select. Analog input (MUX1, MUX2) select
9	4F0C _H	Analog input L-ch (PG3) volume (0 dB) ⁽³⁾
10	500C _H	Analog input R-ch (PG4) volume (0 dB) (3)

(1) V_{DD} should be turned on first or at the same time with other power supplies. It is recommended to set the register data after turning on all power supplies and while the system clock is running.

(2) The audio interface format should be set to match the DSP or decoder being used.

(3) Any level is acceptable for volume or attenuation. The level should return to that recorded in the register data when system was last powered off.

Table 4. Recommended Power-Off Sequence

STEP	REGISTER SETTINGS	NOTE
1	5132 _H	ADC L-ch/R-ch digital soft mute enable, ADC audio interface format (left-justified) ⁽¹⁾
2	5200 _H	Analog front end (ADL, ADR, D2S, MCB, PG1, 2, 5, 6) power down
3	4A00 _H	V _{COM} power down
4	4900 _H	Analog bias power down
5	—	Turn OFF all power supplies. ⁽²⁾

(1) The audio interface format should be set to match the DSP or decoder being used.

(2) Power-supply sequencing is not required. It is recommended to make the required register settings while the system clock is running, then turn off all power supplies.

Power-Supply Current

The current consumption of the PCM1870 depends on the power-up/down status of each circuit module. In order to save power consumption, disabling each module is recommended when it is not used in an application or operation. Table 5 shows current consumption in some states.

	POW	ER SUPPL		NT [mA]	PD	[mW]

Table 5. Power Consumption Table

Audio Serial Interface

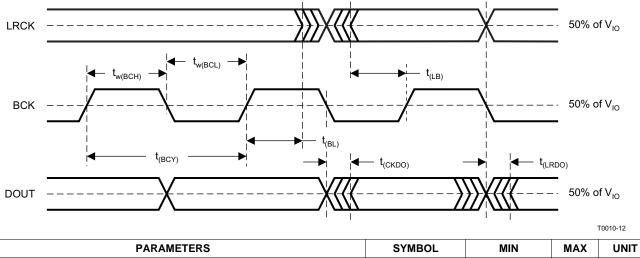

The audio serial interface of the PCM1870 consists of LRCK, BCK and DOUT. Sampling rate (f_s), left and right channel are present on LRCK. DOUT transmits the serial data from the decimation filter for the ADC. BCK is used to transmit the serial audio data on DOUT at its high-to-low transition. BCK and LRCK should be synchronized with audio system clock. Ideally, it is recommended that they are derived from it.

The PCM1870 requires LRCK to be synchronized with the system clock. The PCM1870 do not need a specific phase relationship between LRCK and the system clock.

The PCM1870 has both master mode and slave mode interface formats, which can be selected by register 84 (MSTR). LRCK and BCK are generated from the system clock in master mode.

Audio Data Formats and Timing

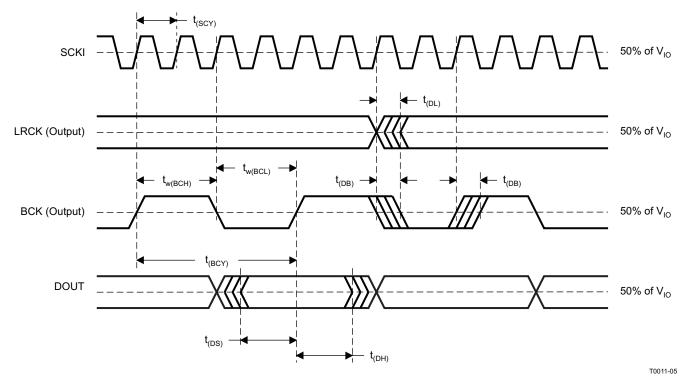

The PCM1870 supports I²S, right-justified, left-justified, and DSP formats. The data formats are shown in Figure 16, and they are selected using resister 70 (RFM[1:0], PFM[1:0]). All formats require binary 2s-complement, MSB-first audio data. The default format is I²S. Figure 14 shows a detailed timing diagram.

PARAMETERS	SYMBOL	MIN	MAX	UNIT
BCK pulse cycle time (I ² S, left- and right-justified formats)	t _(BCY)	1/(64f _S) ⁽¹⁾		
BCK pulse cycle time (DSP format)	t _(BCY)	1/(256f _S) ⁽¹⁾		
BCK high-level time	t _{w(BCH)}	35		ns
BCK low-level time	t _{w(BCL)}	35		ns

When set to multisampling

rate, f_S of BCK is set to half the rate of the DSM operation frequency.

Figure 16. Audio Data Output Formats

THREE-WIRE INTERFACE (SPI, MODE (PIN 28) = LOW)

All write operations for the serial control port use 16-bit data words. Figure 17 shows the control data word format. The most significant bit must be 0. There are seven bits, labeled IDX[6:0], that set the register address for the write operation. The least-significant eight bits, D[7:0], contain the data to be written to the register specified by IDX[6:0].

Figure 18 shows the functional timing diagram for writing to the serial control port. To write the data into the mode register, the data is clocked into an internal shift register on the rising edge of the MC clock. The serial data should change on the falling edge of the MC clock and should be LOW during write mode. The rising edge of MS should be aligned with the falling edge of the last MC clock pulse in the 16-bit frame. The MC can run continuously between transactions while MS is in the LOW state.

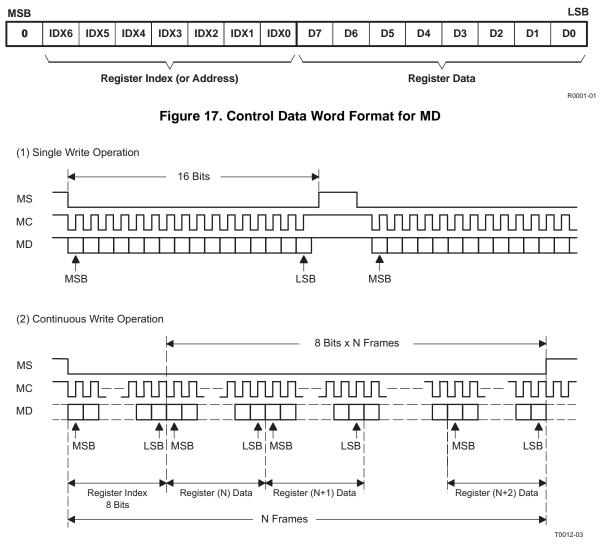

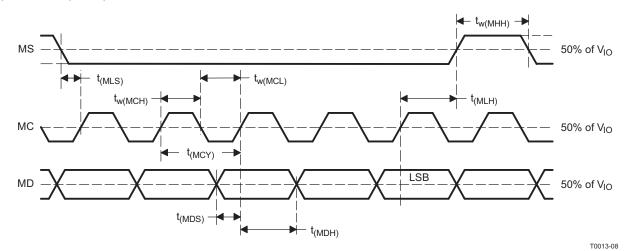

Figure 18. Register Write Operation

Three-Wire Interface (SPI) Timing Requirements

Figure 19 shows a detailed timing diagram for the serial control interface. These timing parameters are critical for proper control port operation.

PARAMETERS	SYMBOL	MIN	TYP	MAX	UNIT

Figure 19. SPI Interface Timing

TWO-WIRE INTERFACE [I²C, MODE (PIN 28) = HIGH]

The PCM1870 supports the I^2C serial bus and the data transmission protocol for the I^2C standard as a slave device. This protocol is explained in I^2C specification 2.0.

In I²C mode, the control terminals are changed as follows.

TERMINAL NAME	PROPERTY	DESCRIPTION
MS/ADR	Input	I ² C address
MD/SDA	Input/output	I ² C data
MC/SCL	Input	I ² C clock

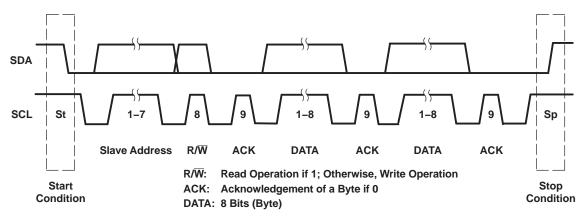

Slave Address

MSB							LSB	
1	0	0	0	1	1	ADR	R/W	

The PCM1870 has its 7-bit slave address. The first six bits (MSBs) of the slave address are factory preset to 1000 11. The next bit of the address byte is the device select bit, which can be user-defined by ADR terminal. A maximum of two PCM1870s can be connected on the same bus at one time. Each PCM1870 responds when it receives its own slave address.

Packet Protocol

A master device must control packet protocol, which is start condition, slave address with read/write bit, data if write or acknowledgement if read, and stop condition. The PCM1870 supports only slave-receiver and slave-transmitter.

Figure 20. Basic I²C Framework

Write Operation

A master can write any PCM1870 registers using single access. The master sends a PCM1870 slave address with a write bit, a register address, and the data. When undefined registers are accessed, the PCM1870 does not send an acknowledgement. The Figure 21 shows a diagram of the write operation.

R0002-01

Figure 21. Framework for Write Operation

Read Operation

A master can read the PCM1870 register. The value of the register address is stored in an indirect index register in advance. The master sends a PCM1870 slave address with a read bit after storing the register address. Then the PCM1870 transfers the data which the index register points to. Figure 22 shows a diagram of the read operation.

Transmitter	М	М	М	S	М	S	М	М	М	S	S	М	М

ALV[5:0]: Gain Control for PG3 (ADC Analog Input R-Channel)

ARV[5:0]: Gain Control for PG4 (ADC Analog Input L-Channel)

Default value: 00

PG3 and PG4 can be independently controlled for ADC input from 30 dB to -12 dB in 1-dB steps. ADC output may have zipper noise when changing levels. In the PCM1870, the noise can be reduced when making the change by using zero-cross detection (Register 85, ZCRS).

HPF[1:0]: High-Pass Filter Selection

Default value: 00

The PCM1870 has a digital high-pass filter to remove dc voltage at the input of the ADC. The cutoff frequency of the high-pass filter can be selected.

HPF[1:0]	High Pass Filter Selection
0 0	f _C = 4 Hz at 48 kHz (default)
0 1	f _C = 240 Hz at 48 kHz
10	f _C = 120 Hz at 48 kHz
11	High-pass filter disabled

RMUL: Digital Soft Mute Control for ADC L-Channel

RMUR: Digital Soft Mute Control for ADC R-Channel

Default value: 1

The digital output of the ADC can be independently muted or unmuted. The transition from the current volume level to mute, or the return to the previous volume setting from mute, occurs at the rate of one 1-dB step for each $8/f_S$ time period. When RMUL and RMUR = 0, the digital data is increased from mute to the previous attenuation level, and when RMUL and RMUR = 1, the digital data is decreased from the current attenuation level to mute. In the PCM1870, audible zipper noise can be reduced by using zero-cross detection (register 85, ZCRS).

RMUL, RMUR = 0 Mute disabled RMUL, RMUR = 1 Mute enabled (default)

DSMC: Waiting Time Turn ADC Mute Off at Power Up

Default value: 0

ADC digital output has waiting time at power up when DSMC = 0. It is recommended to set DSMC = 0.

DSMC = 0	10 ms at 48 kHz (default)
DSMC = 1	No wait

RFM[1:0]: Audio Interface Selection for ADC (Digital Output)

Default value: 00

The audio interface format for ADC digital output has I²S, right-justified, left-justified, and DSP formats.

RFM[1:0]	Audio Interface Selection for ADC Digital Output
0 0	I ² S (default)
0 1	Right-justified

PAIR: Power Up/Down for PG2 and PG6 (Gain Amplifier for Analog Input R-Channel)

PAIR: Power Up/Down for PG1 and PG5 (Gain Amplifier for Analog Input L-Channel)

Default value: 0

This bit is used to control power up/down for PG1, -2 and PG5, -6 (gain amplifier for analog input).

PAIR, PAIL = 0 Power down (default) PAIR, PAIL = 1 Power up

PADS: Power Up/Down for D2S (Differential Amplifier) of AIN1L and AIN1R

Default value: 0

This bit is used to control power up/down for D2S (differential-to-single amplifier).

PADS = 0	Power down (default)
PADS = 1	Power up

PMCB: Power Up/Down Control for Microphone Bias Source

Default value: 0

This bit is used to control power up/down for the microphone bias source.

PMCB = 0	Power down (default)
PMCB = 1	Power up

PADR: Power Up/Down Control for ADR (ADC and Digital Filter R-Channel)

PADL: Power Up/Down Control for ADL (ADC and Digital Filter L-Channel)

Default value: 0

This bit is used to control power up/down for the ADC and decimation filter.

PADR, PADL = 0 Power down (default) PADR, PADL = 1 Power up

RALC: Automatic Level Control (ALC) Enable for Recording

Default value: 0

Auto level control can be enabled with some parameters for microphone input or lower-level analog source.

RALC = 0	Disabled (default)
RALC = 1	Enabled

RRTC: ALC Recovery Time Control for Recording

Default value: 0

This bit selects the time during which a gain level change completes to compress the signal when the input to the ADC increases in amplitude.

RRTC = 0	3.4 s (default)
RRTC = 1	13.6 s

RATC: ALC Attack Time Control for Recording

Default value: 0

This bit selects the time during which a gain level change completes to expand the signal when the input to the ADC decreases in amplitude.

RATC = 0	1 ms (default)
RATC = 1	2 ms

RCP[1:0]: ALC Compression Level Control for Recording

Default value: 00

Auto level control can set the compression level to -2, -6, or -12 dB. Higher-level signals should be compressed to avoid saturation or degradation of sound quality.

RCP[1:0]	ALC Compression Level Control for Recording
0 0	-2 dB (default)
0 1	-6 dB
10	–12 dB
11	Reserved

RLV[1:0]: ALC Expansion Level Control for Recording

Default value: 00

Auto level control can set the expansion level to 0, 6, 14, or 24 dB. Lower-level signals should be expanded to make a small signal easy to hear. If set to 0 dB, the ALC can be operated only as a limiter.

RLV[1:0]	ALC Expansion Level Control for Recording
0 0	0 dB (default)
0 1	6 dB

MSTR: Master or Slave Selection for Audio Interface

Default value: 0

This bit is used to select either master or slave mode for the audio interface. In master mode, PCM1870 generates LRCK and BCK from the system clock. In slave mode, it receives LRCK and BCK from another device.

MSTR = 0	Slave interface (default)
MSTR = 1	Master interface

BIT0: Bit Length Selection for Audio Interface

Default value: 1

This bit is used to select data bit length for the ADC output.

BIT0 = 0	Reserved
BIT0 = 1	16 bits (default)

SRST: System Reset

Default value: 0

This bit is used to enable system reset. All circuits are reset by setting SRST = 1. After completing the reset sequence, SRST resets to 0 automatically.

SRST = 0	Reset disabled (default)
SRST = 1	Reset enabled

NPR[5:0]: System Clock Rate Selection

Default value: 00 0000

These bits are used to select the system clock rate. See Table 8 for details.

MBST: BCK Output Configuration in Master Mode

Default value: 0

This bit is used to control the BCK output configuration in master mode. V_{IO} (I/O cell power supply) power consumption can be reduced by adjusting BCK edge to bit number when setting MBST = 1. This is effective in master mode (register 69 MSTR = 1).

MBST = 0	Normal output (default)	ĺ
MBST = 1	Burst output	

MSR[2:0]: System Clock Dividing Rate Selection in Master Mode (Register 70)

Default value: 000

These bits are used to set the dividing rate of the input system clock. See Table 8 for details.

## Table 9. System Clock Frequency for Application-Specific Audio Clock (continued)

### ZCRS: Zero Cross for Digital Attenuation/Mute and Analog Gain Setting

Default value: 0

This bit is used to enable the zero-cross detector, which reduces zipper noise while the digital soft mute or analog gain setting is being changed. If no zero-cross data is input for a  $512/f_S$  period (10.6 ms at a 48-kHz sampling rate), then a time-out occurs and the PCM1870 starts changing the attenuation, gain, or volume level. The zero-cross detector cannot be used with continuous-zero and dc data.

ZCRS = 0	Zero cross disabled (default)
ZCRS = 1	Zero cross enabled
De vieter 07

#### **IDX[6:0]:** 101 0111b (57h) Register 87

#### AD2S: Differential Amplifier Selector (MUX3 and MUX4)

Default value: 0

This bit is used to select whether a single-ended amplifier or differential amplifier (D2S) is used as the input for the ADC. MUX3 and MUX4 use the single-ended input when AD2S = 0. MUX3 and MUX4 use the monaural differential input when AD2S = 1.

AD2S = 0	Single-ended amplifier (default)
AD2S = 1	Differential amplifier

### AIL[1:0]: AIN1L and AIN2L Selector (MUX1)

#### Default value: 00

MUX1 selects the analog input, AIN1L or AIN2L.

AIL[1:0]	AIN L-channel Select
0 0	Disconnect (default)
0 1	AIN1L
10	AIN2L
11	Reserved

#### AIR[1:0]: AIN1R and AIN2R Selector (MUX2)

Default value: 00

MUX2 selects the analog input, AIN1R or AIN2R.

AIR[1:0]	AIN R-channel Select
0 0	Disconnect (default)
0 1	AIN1R
10	AIN2R
11	Reserved

### **IDX[6:0]:** 101 1100b (5Ch) Register 92

### LPAE: Automatic Attenuation Setting for Bass Boost Gain Control

Default value: 0

A gain setting for bass boost may cause digital data saturation, depending on the input data level. Where this could occur, LPAE can be used to set the same attenuation level as the bass boost gain level for the digital input data.

LPAE = 1 Enable	LPAE = 0	Disble (default)
	LPAE = 1	Enable

### LGA[4:0]: Bass Boost Gain Control

Default value: 0 0000

These bits are used to set bass boost gain level for the digital data. The center frequency for boost is 200 Hz at 44.1 kHz.

LGA[4:0]	TONE CONTROL GAIN (BASS)	LGA[4:0]	TONE CONTROL GAIN (BASS)

## **3DEN: 3D Sound Effect Enable**

Default value: 0

This bit is used for enabling the 3-D sound effect filter. This filter has two independently controlled parameters.

3DEN = 0	Disable (default)
3DEN = 1	Enable

## 3FL0: Filter Selection for 3D Sound

Default value: 0

This bit is used for selecting from two kinds of filter type, narrow and wide. These filters produce different 3-D effects.

3FL0 = 0	Narrow (default)
3FL0 = 1	Wide

## 3DP[3:0]: Efficiency for 3D Sound Effect

Default value: 0000

These bits are used for adjusting the 3-D sound efficiency. Higher percentages have greater efficiency.

3DP[3:0]	3D Sound Effect Efficiency
0000	0% (default)
0001	10%
0010	20%

## NEN2: Second-Stage Notch Filter Enable

Default value: 0

The PCM1870 has a two-stage notch filter. The two stages can separately set filter characteristics. This bit is used to enable the second stage.

NEN2 = 0	Disabled (default)
NEN2 = 1	Enabled

#### **NEN1: First-Stage Notch Filter Enable**

Default value: 0

The PCM1870 has a two-stage notch filter. The two stages can separately set filter characteristics. This bit is used to enable the first stage.

NEN1 = 0	Disabled (default)	
NEN1 = 1	Enabled	

#### NUP2: Second-Stage Notch Filter Coefficients Update

Default value: 0

This bit is used to update the coefficients for the second-stage notch filter. The coefficients written to registers 101, 102, 103, 104 are updated when NUP2 = 1.

NUP2 = 0	No update (default)
NUP2 = 1	Update

## NUP1: First-Stage Notch Filter Coefficients Update

Default value: 0

This bit is used to update the coefficients for the first-stage notch filter. The coefficients written to registers 97, 98, 99, 100 are updated when NUP1 = 1.

NUP1 = 0	No update (default)
NUP1 = 1	Update

#### **MXEN: Digital Monaural Mixing**

Default value: 0

This bit is used to enable or disable monaural mixing in the section that combines L-ch and R-ch digital data.

MXEN = 0	Disabled (stereo, default)
MXEN = 1	Enabled (monaural mixing)

Default value: 0000 0000

These bits are used to change the characteristics of the second-stage notch filter. See *Calculating Filter Coefficients* for details.

## Calculating Filter Coefficients

The PCM1870 provides a dual-stage notch filter at the digital output of the ADC. The filter characteristics of each filter stage can be programmed. The characteristics are determined by calculating coefficients for three parameters, sampling frequency, center frequency and bandwidth, as shown in the following equations. All coefficients must be written as 2s-complement binary data into registers 97, 98, 99, 100, 101, 102, 103, and 104.  $f_S = Sampling frequency [Hz]$ 

 $f_{C}$  = Center frequency [Hz]

$$f_b = Bandwidth [Hz]$$

$$a_1 = -(1 + a_2) cos \left(\frac{2\pi f_C}{f_S}\right)$$

$$a_{2} = \frac{1 - \tan\left(\frac{2\pi f_{b}^{}/f_{S}^{}}{2}\right)}{1 + \tan\left(\frac{2\pi f_{b}^{}/f_{S}^{}}{2}\right)}$$

## G12R: 12-dB Boost for PG2 (Gain Amplifier for AIN1R and AIN2R) G12L: 12-dB Boost for PG1 (Gain Amplifier for AIN1L and AIN2L)

Default value: 0

These bits are used to boost the microphone signal when the analog input is small. See Register 90 for the detailed settings.

## CONNECTION DIAGRAM

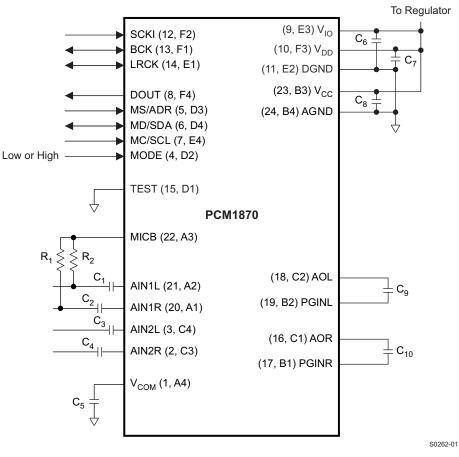

Figure 24. Connection Diagram

Table 10	Recommended	External	Parts
----------	-------------	----------	-------

C ₁ –C ₄	1 μF–10 μF	C ₉ , C ₁₀	1 μF–10 μF
C ₅	1 μF–4.7 μF	R ₁ , R ₂	2.2 kΩ
C ₆	0.1 µF		
C ₇	1 µF		
C ₈	1 μF–4.7 μF		

## BOARD DESIGN AND LAYOUT CONSIDERATIONS

## $V_{CC}$ , $V_{DD}$ , and $V_{IO}$ Pins

The digital and analog power supply lines to the PCM1870 should be bypassed to the corresponding ground pins with 0.1- to 4.7-µF ceramic capacitors or electrolytic capacitors, placed as close to the pins as possible to maximize the dynamic performance of ADC.

## **AGND and DGND Pins**

To maximize the dynamic performance of the PCM1870, the analog and digital grounds are not connected internally. These grounds should have very low impedance to avoid digital noise feeding back into the analog ground. So, they should be connected directly to each other under the part to reduce the potential of noise problems.

#### AIN1L, AIN1R, AIN2L, and AIN2R Pins

AIN1L, AIN1R, AIN2L, and AIN2R are single-ended inputs. AIN1L and AIN1R can also be used as a monaural differential input. The anti-aliasing low-pass filters are integrated on these inputs to remove the out-of-band noise from the audio. If the performance of these filters is not good enough for an application, appropriate external anti-aliasing filters are needed. The passive RC filter (100  $\Omega$  and 0.01  $\mu$ F to 1 k $\Omega$  and 1000 pF) is used in general. Any pins that are not used in an application should be left open. Do not select open pins through register settings.

#### AOL, AOR, PGINL, and PGINR Pins

When AIN1L, AIN1R, AIN2L, and AIN2R pins are used as microphone inputs with high gain, AOL and AOR may have a large dc offset. It is recommended to locate a dc-blocking capacitor (1- to 10-µF capacitor) between AOL/AOR and PGINL/PGINR. If an application is not affected by dc offset, the PCM1870 does not need the capacitors.

## V_{COM} Pin

 $1-\mu F$  to  $4.7-\mu F$  capacitor is recommended between V_{COM} and AGND to ensure low source impedance for the ADC common voltage. This capacitor should be located as close as possible to the V_{COM} pin to reduce dynamic errors on the ADC common voltage.

#### BCK (Master Mode) and DOUT Pins

BCK in the master mode and DOUT have adequate load drive capability, but if the BCK and DOUT lines are long, locating a buffer near the PCM1870 and minimizing load capacitance is recommended in order to minimize crosstalk between digital and analog circuits, maximize the dynamic performance of the ADC, and reduce power consumption.

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND**: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

⁽³⁾ MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

- C. QFN (Quad Flatpack No-Lead) Package configuration.
- D. The package thermal pad must be soldered to the board for thermal and mechanical performance.

E. See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions.

F. Falls within JEDEC MO-220.

# RHF (R-PVQFN-N24)

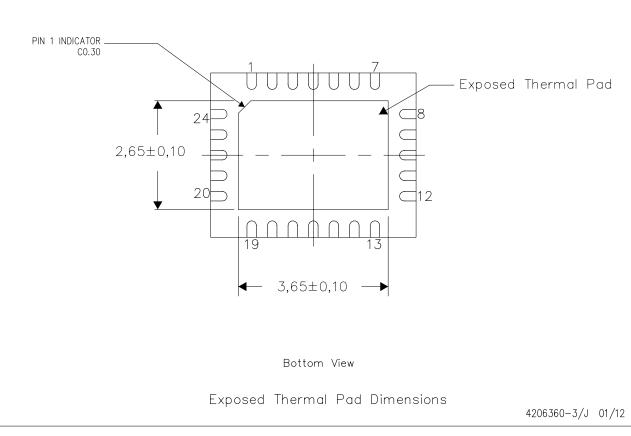

# PLASTIC QUAD FLATPACK NO-LEAD

## THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

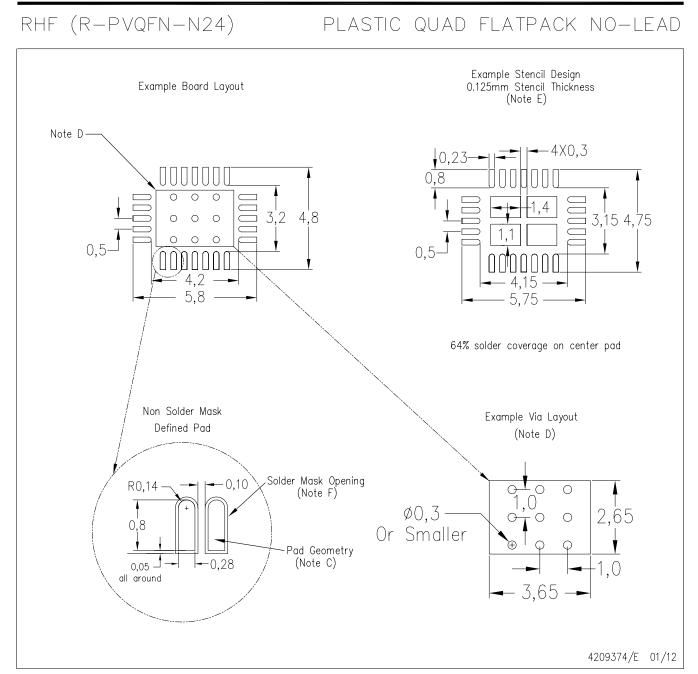

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

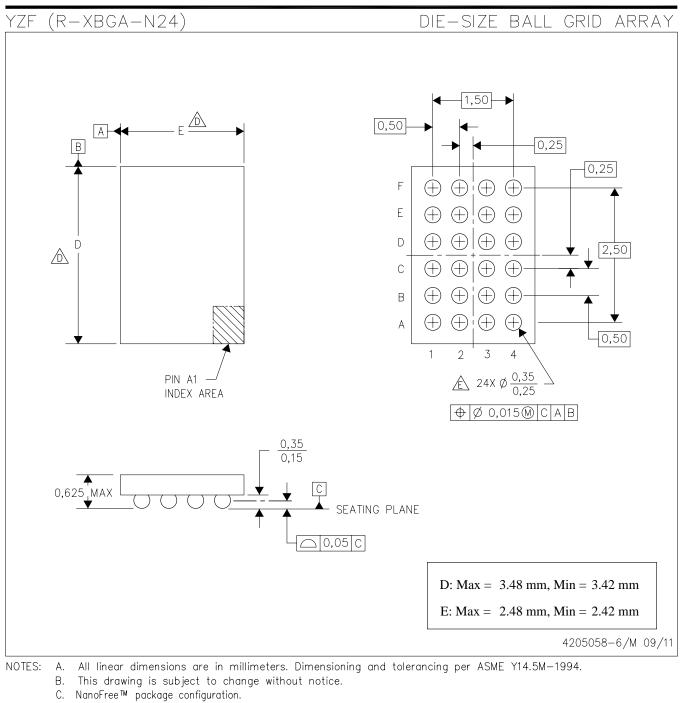

NOTES: A. All linear dimensions are in millimeters.

- B. This drawing is subject to change without notice.
- C. Publication IPC-7351 is recommended for alternate designs.
- D. This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, Quad Flat-Pack Packages, Texas Instruments Literature No. SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <a href="http://www.ti.com">http://www.ti.com</a>.
- E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
- F. Customers should contact their board fabrication site for recommended solder mask tolerances and via tenting recommendations for vias placed in thermal pad.

# **MECHANICAL DATA**

The package size (Dimension D and E) of a particular device is specified in the device Product Data Sheet version of this drawing, in case it cannot be found in the product data sheet please contact a local TI representative.

A Reference Product Data Sheet for array population.

4 x 6 matrix pattern is shown for illustration only.

F. This package contains Pb-free balls. Refer to YFF (Drawing #4207625) for tin-lead (SnPb) balls.

NanoFree is a trademark of Texas Instruments.

#### **IMPORTANT NOTICE**

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
